Mr. Lockhart denied that the house had, under the existing law, sufficient power to correct the evil which the present bill had been framed to check. The hon. gent. (Mr. Wynn) had not, in the course of his speech, denied that corrupt practices existed; and it was well known, that in some corporate bodies those practices were carried to an enormous extent. Surely such a system should be done away with.

Mr. H. Gurney objected to the length of time within which the bill allowed complaints to be made.

Mr. N. Calvert observed, that every means ought to be taken to put down bribery at elections. The right of voting ought to be considered as a trust, and not treated as if it were a property: and the moment the electors of any place were found guilty of corrupt practices, they ought to be disfranchised. The hon. gent. adverted to a case, in which it was clearly proved that the election of an individual was secured by a plentiful supply of new Bank of England notes, that individual being connected with the Bank.

Col. Davies said, that it was sufficient to remove a member from his place, and to seat another in his room, if the petitioner only proved that one or two persons had been bribed. Now surely, when that was the case, the house would not rashly infer that the whole of the electors were corrupt, and proceed to disfranchise them.

Mr. W. Smith thought that the evil which this bill was intended to repress required correction. Some years ago he had a negotiation for one of those open boroughs, as they were called; but when he came to inquire into the business, he found that the former member had promised 10*l.* to each of the electors, which debt had been left unpaid. Now, what was the new candidate called on to do? He was told, that he must put into the Post-office a certain number of 10*l.* notes, directed, under cover, to such and such persons, before he could proceed further (laughter). How they were to be afterwards disposed of, the candidate, of course, could not exactly say, though he could easily guess. Any person paying the least attention to election proceedings in many places, might perceive that corrupt practices were carried on, although, in most cases, they would find it difficult to bring the charge home to any individual.

Mr. Hobhouse said, an intelligence had gone abroad on this, as well as on the other subjects, which rendered it impossible that the law should be continued in its present state. He saw no

great force in the observations of the hon. gent. (Mr. Warre), that the electors ought to proceed to reform themselves; because it was evident, that if there were none to offer bribes, no person could be bribed. The house ought, therefore, to begin with those who were desirous of procuring seats in parliament. The law ought to be so framed as to make it impossible for any person to introduce himself into parliament by base and dishonest means. The state of the law was extremely imperfect; and in many instances the house had not neglected its duty, but was unable, in consequence of that state of the law, to perform it. There was a striking instance in that house, at the present moment, of the inefficacy of the law. A petition was presented against the return of a certain borough, and one of the individuals connected with that election was sent to prison, while the other took his seat in that house, where he still remained, although he (Mr. Hobhouse) could perceive little difference in the two cases. He knew not whether the noble lord's bill would have the effect which was contemplated; but he would support it, because he was glad to see the house taking any step on this subject, considering, as he did, that bribery at elections was the root of every evil which afflicted the country. After what had been said, he thought the house could not refuse to go into a committee on this bill. It was most notorious that corruption did prevail to a very great extent. There was a standing order of that house forbidding the interference of peers in the election of members of parliament; but it was well known that it was not regarded. He agreed perfectly in the statement contained in the petition of one of his constituents which he had presented last year, where it was clearly shown that this standing order was not attended to, and that the peers constantly interfered in elections. His hon. friend (Mr. W. Smith) need not have introduced to the house, the statement relative to the borough, the electors of which were to be paid up their 10*l.* arrears. It was not necessary to point out isolated cases, when it was well known that many gentlemen who sat in that house were only representatives of their own money. One individual (the late Mr. Ricardo), who had distinguished himself as much as any individual of the age, paid 1000*l.* a year to serve as member for a place (Portarlington) which he never saw. When he heard gentlemen congratulating each other on the purity of parliament, and gravely declaring there was no necessity for reform, he could not help thinking of the words of Cicero, when he said, "I wonder how one augur can ever meet another without laughing." In like manner, he (Mr. Hobhouse) wondered how, on such occasions, one member of parliament could look in the face of another without laughing. When the whole system was one great blot, he knew not where to commence the cleansing process; but certainly he always would support the efforts made by others for that purpose, although they might fall short of his own views and wishes.

Mr. F. Palmer was perfectly convinced that some sort of reform in parliament, for which the people had been calling for the last twenty years, ought to be introduced. The people looked to that house for such a reform; and he thought, that if the house did not reform itself from within, it would ultimately be reformed from without.

Lord *J. Russell* said, the statements which had been made this night, proved that some measure of this kind was absolutely called for. The general election was approaching, and no doubt could be entertained that bribery and corruption were now going on. This rendered it the more necessary to make a speedy alteration in the law. It was notorious, that the returns to that house were, in many instances, made in virtue of money, and nothing else. It was a remarkable circumstance, that when the hon. member (Mr. Grenfell) had apprised his constituents that he would decline making any advances to that borough, if likely to be attended with pecuniary expense, the solicitor of the Bank immediately went down to form a connexion with that place, where he was not at all known (hear). The noble lord then pointed out the inefficiency of the Grenville act (the provisions of which might be evaded by postponing the act of bribery until fourteen days after the election,) to meet the evil, and concluded by calling on the house to suffer his bill to be considered in a committee.

The bill was then read a second time, and ordered to be committed on Monday next.

FRIDAY, MAY 26.—Lord *John Russell*, agreeably to his notice, rose to propose certain resolutions on the subject of bribery and corruption. In the year 1775 a resolution was come to by the house, that if any member should obtain his seat by bribery and corruption, he should be visited with the utmost severity of the house; but, notwithstanding this, it was notorious that bribery and corruption prevailed to an enormous extent, and that in many boroughs it was the practice for the agents of the candidates to give sums of money to the different voters, after the expiration of the fourteen days during which petitions might be presented to the house complaining of undue elections, by which expedient parties were enabled to practise the most gross bribery with impunity. Unless the house were resolved to put an effectual stop to such proceedings, it would be much better that voters should be allowed to sell their suffrages to the best bidder, in the same way as they sold their chattels, or other articles of merchandise; because it was quite a farce that there should be bills in the statute-book, and resolutions on the journals of the house, against bribery and corruption, whilst so many members procured their seats there by such means, and totally set these acts and resolutions at defiance. He concluded by moving the resolutions—

"1. That whenever a petition shall be presented to this house, after the expiration of the time allowed for presenting petitions against the validity of the return of any member of this house, by any person or persons, affirming that at any time within 18 calendar months previous to presenting the said petition, general bribery or corruption has been practised, for the purpose of procuring the election or return of any member or members to serve in parliament for any borough, cinque port, or place, and it shall appear to the said house that such petition contains allegations sufficiently specific to require further investigation, a day and hour shall be appointed by the said house for taking the said petition into consideration, so that the space of 20 days shall intervene between the day on which the said petition shall have been presented and the day appointed by the said house for

taking the same into consideration; and notice of such day and hour shall be inserted, by order of the Speaker, in one of the two next *London Gazettes*, and shall also be sent by him to the returning officer of the borough, cinque port, or place, to which such petition shall relate; and a true copy of such notice shall by such returning officer be affixed to the door of the town-hall or parish church nearest to the place where the election of members to serve in parliament for such borough, cinque port, or place, has been usually held.

"2. That at the hour appointed by the said house for taking such petition into consideration, the said house shall proceed to appoint a select committee to inquire into the truth of the matters contained in the said petition, and report the result of their inquiry to the said house; and such select committee shall consist of 13 members, to be chosen by lot, according to the directions, provisions, rules, and regulations, and subject to the exemptions for choosing 20 members by lot, contained in the various acts to regulate the trials of controverted elections, or returns of members to serve in parliament, so far as they are applicable thereto, and of two others to be appointed by the said house, out of the members then present in the said house; and the 13 members so chosen by lot, together with the two members to be so appointed by the said house, shall be a select committee, and shall inquire into and try the matter of such petition, and shall report their opinion thereof, together with the evidence given before them, to the said house."

Mr. *C. W. Wynn* said, that there was already a proper tribunal for investigating and redressing the evils of which the noble lord complained, and he himself was fully aware of the existence of the practice of giving money to the voters after the expiration of the fourteen days, but he thought this might be checked by directing the Attorney-General to prosecute, or where this species of corruption had prevailed very extensively amongst the voters of any particular borough, by disfranchising it. He thought it would be better if the noble lord, instead of pressing his resolutions at this very late period of the session, were to give notice, that if any gross case of corruption should in future arise, he would bring it before the notice of the house.

Lord *John Russell* could not consent to withdraw his resolutions. The hon. member had pointed out other modes by which bribery might be suppressed, and on that account had argued, that these resolutions were superfluous; but in this reasoning he would give one short answer.—all these other modes were in existence at present, and still bribery and corruption prevailed to a very great extent. He should, therefore, persist in taking the sense of the house on the resolutions.

Mr. *Wynn* then moved the previous question.

Mr. *Peel* wished the noble lord would have listened to the suggestion of postponing his resolutions, because the house could not be prepared at a moment, and without consideration, to come to a decision upon them. For his own part, he did not disapprove of the principle contained in them; but at the same time, without having bestowed some further attention upon them, he could not take upon himself to say, at an instant, that he could concur in them; besides, he was disposed to think that the noble lord's object would be better effected by a bill, than by resolutions.

Mr. *Warre* thought the noble lord was placed in a very hard situation. When he brought in a bill, he was told he ought to have proposed resolutions; and when he proposed resolutions, he was told he ought to have brought in a bill. The *rt. hon. gent.* (Mr. *Wynn*) had said, that these acts of corruption might be punished by a prosecution by the Attorney-General, or by disfranchising the offending borough. Certainly this had been done in the Grampound case; but how rarely amongst the numerous instances of corruption which occurred, was one punished in this manner; and indeed, the Grampound case would have escaped with impunity if the delinquents had not quarrelled amongst themselves.

Lord *Millon* observed, that this motion was by no means improper to be introduced at the close of the parliament; but if left till next session, some of the boroughs might, under the present system of the house, have a right to complain; and it would induce some persons to look with a lenient eye to them.

Mr. *Lockhart* was of opinion, that the words of the resolution were not sufficiently comprehensive, so as to reach every species of bribery. He referred to the practice of giving money to electors after the election was over.

Mr. *Brougham* said, that the practice referred to by the hon. member, of paying the electors after the election, though unconnected with any previous promise, was illegal. He had no doubt of its being an act of corruption and of gross illegality. Although an act of bribery, it might be a question how far the vote was disqualified thereby. His noble friend might, however, modify the resolution. It was extremely desirable that the opinion of the house should be taken on this motion: if the opinion of the house, or even of a large portion of the house, was in favour of it, he thought it would have a good effect upon elections. We were now in a very delicate situation; the machinery was in operation; the instruments of bribery were now at work; and he looked with anxiety to the interruption of the practices going forward in all quarters, which this motion might occasion. He conjured every person present—and he appealed to him, as he valued his own interest, and that was the strongest way he could put it to him—to vote for these resolutions, assured that it would prevent the engines of corruption being employed against himself.

Mr. *Hume* begged to state, that he had received a letter from an elector in a certain place, intimating that they were prepared to receive any person who would pay 3000*l.* (a loud laugh); that the practice had been to pay each of the 500 electors 5*l.*; and that the remaining 500*l.* was for expenses (a laugh).

Mr. *Hudson Gurney* would support the motion for the previous question. Was there, he asked, a member in the house who did not believe that every person who held a seat in that house must pay for it (loud cries of no, no)? All that could be done was to make the bribery laws more explicit than at present. He believed that no member could be returned without doing some act against the law as at present constituted. Either in meal or malt (a laugh) it was the common understanding amongst persons to accommodate themselves more or less to the general practice. The bribery laws should be rendered more plain, simple, precise, and just.

Mr. *Alderman Wood* felt called upon to no-

tice the extraordinary assertion of the hon. member (Mr. *Gurney*) (hear, hear), in which he represented all as having their price. But if he asserted that all members must pay either in meal or malt, he (Mr. *Wood*) would tell that hon. member, that he had been three times returned for the city of London, and had never spent a shilling, even for conveyance of electors: though he had had applications from the country for that purpose, he invariably refused, and never expended a shilling even for a bowl of punch: the hon. member would probably understand his meaning. He did not think his remarks did much credit to the borough that that hon. member represented, and he supposed the price there must be pretty high (a laugh).

Sir *Robert Wilson* observed, that the hon. member (Mr. *H. Gurney*) was but little acquainted with Southwark. He (Sir *Robert Wilson*) had never paid one shilling, either in meal or malt; neither had his hon. colleague, in one or the other, or—what was more in his way—the essence of malt (a laugh).—It was, in his opinion, the duty of the house to pass this resolution with a great majority.

Sir *M. W. Ridley* would deny the accusation which had been made against the members of the house, as far as he was concerned: he should vote for the motion, and recommended all members to do the same.

General *Gascoyne* felt the accusation to be directed as much against the electors as the elected. He could only say that he had represented Liverpool for thirty years, and never had paid his constituents, either in meal or malt, or in any way directly or indirectly.

Mr. *F. Palmer* vindicated himself and his constituents from the accusation. There had been an election committee sitting at the place he represented (Reading) every Tuesday for three months past: it would meet next Friday; and if the hon. member (Mr. *Gurney*) would attend there, they would give him a lesson as to how elections were conducted.

Mr. *T. Wilson*:—With respect to the offer of a seat, on the payment of 5*l.* a man, mentioned by the hon. member (Mr. *Hume*), he (Mr. *Wilson*) thought that it must have been a hoax played off upon him; for, considering that the hon. member was such a strenuous advocate for purity of election, he was likely to be the last man to whom such an application would be made (hear).

The house then divided; when the numbers were found to be equal, namely—For the first resolution, 62—Against it, 62.

The *Speaker* gave his casting vote in favour of the resolution as follows:—

“It now being his duty to give his vote, and considering the proposed resolution as merely declaratory of what are the powers and what is the duty of the house, and that any inaccuracy in the wording of the resolution might be amended when in the new parliament it must be re-voted, he should give his vote in the affirmative.”

The second resolution was then put, and agreed to.

### *Private Committees.*

WEDNESDAY, APRIL 19.—Mr. *Littleton* said, in laying before the house the resolutions he was now about to propose, and in moving the appointment of a committee to investigate this

subject, last year, nothing was farther from his thoughts than the hope of devising an effectual and decided remedy for all the evils which were complained of as being connected with the present system of getting private bills through that house. He deemed it, however, necessary, for the benefit of the public at large, that some alteration should be made in the constitution of committees on private bills. He knew that the complaints which were made against the proceedings of committees, out of doors, could not be effectually cured by any regulation of those committees, or even by the interference of the house itself. Indeed, he believed that the members of that house, in many cases, had most reason to complain of the course taken with reference to private bills. They were all aware that the conduct of conflicting parties, out of doors, was such as imposed great labour, and inflicted no little pain, on those who were obliged to attend private committees. In the most trifling cases, even when the most trifling road bill was in progress, the litigating parties took every means that came within their reach to create delay and increase the expenditure. This, however profitable it might be to some persons, became a subject of remonstrance and complaint amongst the parties in the country, and the whole blame was immediately attributed to the forms of the house, or to the constitution of its committees. But, where a bill was of extensive importance—where it held out some prospective advantage to the immediate interests of one party, while it threatened to affect, unfavourably, the interests of another—they well knew how acrimonious the opposition became. Efforts of every description were resorted to, for the purpose of effecting the particular object of each of these conflicting bodies. In such a state of things, it could not be expected that either party would be reconciled, at the time, to the decision of the house; and though they were themselves to blame, they threw all their complaints on parliament. The parties by their litigious conduct harassed and wearied the members of the house; and the proceedings they frequently adopted to carry their point were alike destructive of the ends of public and private justice. He did not know of any course by which all those evils could be removed; but if any of them could be fairly traced to the constitution of the committees, or to the conduct of individual members, the house had a right to apply a remedy. They knew that cases had occurred in which members had conducted themselves in a way which showed that they were regardless of their own honour, and of the interests of the public. He did not feel it necessary to particularize those cases. He thought it necessary to abstain from doing so, though he certainly could name them; but if gentlemen were disposed to deny the facts he stated, at least they must allow, that constituted as the committees were at present, it was possible that misconduct might arise; and his resolutions would meet that defect. Several remedies had been proposed to remove the existing evils. One was (if it could be called a remedy) to leave things just as they were at present, and to make every impropriety committed up stairs a subject of complaint to the house. As this was the system that had been acted on with so little success, it was not fit that it should be continued. Another plan was, to have, at the commence-

ment of each session, a general system of select committees, to be nominated by ballot, to which private bills should be referred. But, when they looked to the important occupations of the house, some members charged with the consideration of affairs deeply affecting the national interest—others employed on professional and commercial subjects—the time of the county members taken up with an extensive and laborious correspondence—many gentlemen absent from age or sickness, and the occasional absence, upon urgent business, of all when they considered this, he did not think the proposition could be carried into effect. There was another plan, more easy of adoption, but certainly less constitutional in its nature; that was, to refer every bill which seemed likely to be contested, to a committee of inquiry. He, however, would oppose this departure from the old established custom. He therefore thought the safer and preferable course would be, to adhere as far as possible to the system established at present, providing, that where any case of decided abuse in a committee up stairs was fairly made out, the parties complaining should be entitled to apply for a select committee, to be appointed by ballot, who should proceed with the consideration of the bill. This would prevent parties from having any reason to complain that justice had not been rendered to them. Thus, though individuals who sat on the original committee on a bill, might, from local causes, be supposed to have some interest in the measure, no such undue bias could exist where a select committee was appointed by ballot. By this plan, one just cause of complaint would be removed. But, it would mainly operate to prevent the necessity of having resort to a select committee. For how was it possible, when the members of a committee knew, if they acted improperly, that their conduct would be brought before the house, and their decision would perhaps be reversed by a select committee, that they could act otherwise than correctly? If this regulation were found to be efficient, it might be continued; but if otherwise, it could be modified or abandoned. It appeared desirable to him that an alteration should be made in the present distribution of counties for the formation of committees on private bills. He did not know on what ground that distribution was framed, but he thought the inequality of the numbers of members in each list was too great. Thus, on private bills, for the county of Wilts, 194 might attend; for Somersetshire, 176; for Derbyshire, 80; for Leicestershire, 69; for Hampshire, 234; for Staffordshire, 66; and so on. He did not know the reason of this variation, but it produced most mischievous effects. The resolutions which he was about to propose, would secure an efficient attendance for each county. If these resolutions were carried, they must be considered only in the light of trial and experiment, and not as intending to interfere in any degree with the present established system. By agreeing to them, the house would remove much that was complained of out of doors, and as much, he thought, as their own house required, or the interest of the people demanded. The hon. gent. then moved his resolution:—  
“That the present distribution of counties, for the purpose of forming committees on private bills, prepared under the direction of the Speaker, some years ago, has, from the great

inequality of the numbers of members contained in each list, and from other causes, been found not to answer the object for which it was framed.

"That, with a view more nearly to equalize numbers, and to correct too strong a prevalence of local interests on committees on private bills, it is expedient that a new distribution of counties should be made, containing in each list, as nearly as may be, 190 members; one-half only, or thereabouts, to be taken from the county immediately connected with the object of the bill, and the adjoining counties; and the other half from other more distant counties of Great Britain and Ireland; and that the members serving for such counties, and the places within such counties, should constitute the committee on each bill.

"That Mr. Speaker be requested to direct a new distribution of counties to be prepared at the commencement of each session, in such manner as shall be approved of by him, conformably to the principle of the foregoing resolution.

"That every committee on a private bill be required to report to the house the bill referred to it, with the evidence and minutes of the proceedings.

"That a committee be appointed at the commencement of every session of parliament, to be called 'The Committee of Appeals upon Private Bills;' which committee shall consist of all the knights of the shire, all the members for cities, and such other members as may be named therein; so that the whole number appointed to serve upon such committee shall amount to 200 at least.

"That where any party interested in a private bill, who shall have petitioned the house, and shall have appeared in support of his petition, by himself, his counsel, or agent, in the committee upon such bill; or, where the promoters of a private bill shall be dissatisfied with any vote of the committee upon such bill, and shall petition the house, setting forth the particular vote or votes objected to, and praying that they may be heard, by themselves, their counsel, or agent, against such vote or votes, such petition shall, together with the report of the committee upon the bill, and the minutes and evidence taken before such committees, be referred to a select committee of seven members of the house, to be chosen by ballot from the committee of appeals upon private bills; which select committee shall hear the arguments of the parties complaining of, and also of the parties supporting such vote or votes, and shall report their opinion thereon to the house.

"That whenever a petition shall be presented, complaining of any vote of a committee upon a private bill, the house will fix a day whereon to ballot for a select committee, to whom such petition shall be referred, upon which day, at a quarter past four o'clock, or as near thereto as the question which may be then before the house will permit, the Speaker shall order the doors of the house to be locked, and the names of the members composing the committee of appeals upon private bills being written upon separate pieces of paper, and put into the glass, the clerk shall draw therefrom the names, until seven members of such committee who shall be then present, and who shall not have voted in the committee upon the private bill to which the petition refers, shall have answered

to their names; which seven members shall be the select committee to whom such petition shall be referred, and such select committee shall meet for business the following day, at eleven o'clock, and continue to sit, *de die in diem*, until they shall have reported upon the same.

"That no member of such select committee shall absent himself therefrom during its sitting.

"That such select committee shall, if they think fit, after the hearing of such argument, order the party or parties complaining to pay the whole or any part of the costs attending the same: (to which these words were added, as an amendment), and that only one counsel or agent shall be heard in support of the petition of any one party.

"That the party or parties complaining shall, previously to the balloting for such select committee, enter into recognizances, he, she, or they, in the sum of 300*l.*, and two sureties in the sum of 150*l.* each, for the payment of such costs as may be awarded against him or them."

Mr. R. Colborne observed, that if any malpractices occurred in a private bill committee, under the present system, it was competent to any member to complain to the house, and to have the evil redressed. The hon. mover seemed to think that his plan would make members more scrupulous in the discharge of their duties on private committees than they were at present. But public opinion was the great corrective in cases of that kind, as well as in those of every other description where public men were employed. He knew very well that litigious men might defeat a measure upstairs, by delaying time, and increasing expense. But it was difficult to say by what possible means that could be prevented. His impression was, that individuals would feel very unwilling to encounter the expense attendant on an appeal to a select committee. He believed they would find it impossible to apply any remedy to the evil, except by the adoption of a summary process.

Mr. W. Peel hoped the resolutions of the hon. gent. would be agreed to. The unjust and disgraceful manner in which the private business of the house was carried on, rendered any change desirable. Any gent. who entered a committee-room must feel disgusted at the conduct of parties engaged in private bills. There was nothing like a fair and just consideration of the subject. He had seen every art exerted to defeat a bill—he had seen every stratagem adopted to procure a vexatious and ruinous delay. If these resolutions were carried, it would put an end to this system, and with it, to those innumerable letters of invitation which gents. found on their tables every morning, soliciting them to come down and support bills without having heard one word of the evidence on which they were founded (hear).

Mr. S. Whitbread gave his cordial assent to the resolutions. The great evil of the system, and that of which he must loudly complain, was the power which it gave to every member to come down to the house and vote on a bill without having heard or read a particle of the evidence relative to it. The only objection against the resolutions was, that members could not find time to perform the duties which they imposed; but he had always understood that members were sent to that house to give their time and attention to the discharge of duties

which they had voluntarily undertaken to perform.

The *Chancellor of the Exchequer* said, he had not much experience in private business; but from all he had ever heard on the subject, he was led to believe that there was something in the manner in which it was carried on not at all creditable to the house. With regard to the hon. member's resolutions, it was difficult to say beforehand, how far the whole of them might be calculated satisfactorily to meet the evil which had been pointed out (hear). That could only be ascertained by experience; and after all they had heard on this question—after being informed of the manifest grievances which arose out of those committees as they were at present constituted, they were called upon to do the best they could for the improvement of the system (hear). If the resolutions failed, or if there were any insurmountable difficulty in the application of them, it would be competent to parliament to alter or rescind them. But it would be very much to be lamented, if, on account of any apprehended difficulty, they were to let the matter lie over, as they had done last year, without making any attempt to ameliorate the system. He therefore should support the resolutions (hear).

Mr. *Calcraft* conceived that what the *Chancellor of the Exchequer* had just said, was a very strong reflection on the conduct of persons whose proceedings, it appeared, from his own statement, he had not witnessed. A great complaint was made, that persons voted without hearing evidence. In that house individuals frequently decided on a subject without hearing the argument; and in the committees up stairs, *gents.* acted upon confidence, just as they did below. He knew not, for his own part, how any resolution of the hon. member could alter this. The hon. gent. had observed, that the arrangement of the counties, with reference to the number of members who might attend on committees, was not equal; and therefore he proposed to alter that arrangement. Now he would ask, what advantage would that produce in the constitution of committees? He (Mr. *Calcraft*) might as well object to the representation of the people, because in one place there were 20 electors, in another 10, and in another 1000. He might, with as much reason as the hon. gent. had on his side, say, "You must alter the number of voters, or the people are not represented." Besides, he thought the present was an improper time to agitate this question; because, by doing so, they were judging of the conduct of a new parliament—they were assuming that the conduct of that parliament would require this new system. The hon. gent. having seen exceptionable conduct in this parliament, anticipated similar conduct in the parliament that was to come. But he (Mr. *Calcraft*) was not prepared to pronounce judgment on the ensuing parliament. The hon. member never would be able to induce the members for Cornwall to attend to the private business of the members for Yorkshire. They might come down and vote in those private committees, just as they did at present. The hon. member (Mr. *W. Peel*) had praised these resolutions, because, he said, they would put an end to those amicable communications which passed from one individual to another, with respect to private bills. But surely no resolution could possibly have any

such effect. Besides, he (Mr. *Calcraft*) was certain that none of those letters which the hon. gent. found on his table every morning could in the least influence his vote. He would throw them into the fire, and vote as if he had never seen them. Nay, he was convinced that, even if the hon. gent. received a letter from the most beautiful woman in London, his vote would remain as unbiassed as if the letter had never reached his hands (laughter). A good deal had been said about the difficulties and delays which frequently occurred in private committees. Much of that delay might be attributed to the conduct of counsel, who were sometimes called upon to attend twenty committees together. He did not mean to say any thing personal of any professional man, but it was sometimes necessary to get up a debate in private committees, until your friend the counsel arrived—otherwise the junior counsel took up the case—or else, perhaps, the committee was adjourned (a laugh). That there were at times irregularities in those committees he would admit; but not to such an extent as to prevent justice from being done by the house in those cases. He never knew a case, which was properly and clearly made out, where the house did not speedily set the matter right. It was futile to tell him that they could not place the same confidence in the justice of the committees up stairs as they might place in the justice of the house itself. He could not assent to this Utopian doctrine. One case he had himself complained of; and the hon. gent. who was now the great reformer, was in that instance the principal performer. But the house soon set that case to rights; and he was quite certain that any man or woman might obtain justice at their hands with equal ease.

Lord *Althorpe* said, the present resolutions did not go precisely and directly to any one of the causes of complaint. He was very much afraid that the right of appeal to a select committee would not produce the effect which the hon. member anticipated, while the new system must inevitably throw a great deal of additional labour on the members of that house.

Sir *M. W. Ridley* said, he felt one great objection to the plan now proposed, which had not yet been noticed. It was, that in the next parliament, not merely a great part, but the whole of the members of that house would probably be occupied on election committees (hear); and let *gents.* calmly consider, what an immense load of additional labour would be thrown on the members and the officers of the house, if they were called on, under these resolutions, to ballot for select committees to consider private bills. For this reason, he would oppose the motion.

Mr. *Banks* said, as a matter of pure experiment, he would not oppose the present adoption of the resolutions, because some mode was desirable for getting rid of the evils and difficulties which now prevailed. But he was convinced that the duties put upon some members by them, were too onerous to allow its continuance beyond the end of the next session.

Sir *T. Acland* said that the only real use of the resolutions, would be the certainty of there being a court of appeal from the ordinary decisions of committees on private bills, which were too often carried, by crowds being brought down of members who had heard not one word of the merits of the question.

Lord *A. Hamilton* did not believe that the house would appoint such a committee, or, that if appointed, it would come to any decision. The house divided on the seventh resolution—Ayes, 48—Noes, 31—Majority, 8; after which, the resolutions were agreed to.

*Liability of Members to serve on Juries.*

MONDAY, FEB. 20.—Mr. *Holford* complained that he had been served with a summons to serve on a jury in the Court of Exchequer, in the case of the King v. Steel; whereupon, after a few remarks, it was ordered, "That the matter of the said complaint be referred to the Committee of Privileges, to examine the same, and report their opinion thereupon to the house:—Instruction to the said committee, that they do sit and proceed to-morrow."

The committee next day reported that they had examined the matter of the said complaint, and had come to the following resolutions:

1. "That it appears to your committee to be amongst the most ancient and undoubted privileges of parliament, that no member shall be withdrawn from his attendance on his duty in parliament to attend on any other court."

2. "That this privilege, with respect to service upon juries, has been repeatedly asserted, as will be seen from the three following cases:

"On the 22d November 1597, Sir Edward Hobby moved the house for privilege for Sir John Tracie, being a member of this house, and now presently at the Common Pleas, to be put on a jury. Whereupon the serjeant of this house was presently sent with his mace to call the said Sir John Tracie to his attendance in this house; which was thereupon so done accordingly, and the said Sir John then returned to this house."

"On the 6th of May 1607, it was informed that Sir Thomas Biggs and Sir Thomas Lowe, two members of the house, were by the sheriff returned in the court of King's bench, jurors upon an attain between John Macham, tenant to the Lord Barkley, and Edward Beard, tenant to the Lord Viscount Lisle, and was conceived that in this case, by the privilege of the house, they ought to be spared from their attendance:—which was ordered accordingly, and Mr. Serjeant commanded to go with his mace and deliver the pleasure of the house to the secondary of the King's Bench, the court then sitting."

"On the 15th of May 1628, Sir Walter Ailford returned of a jury this day in the Common Place, to have privilege of parliament not to serve; and a letter to be written by Mr. Speaker to the judges, that he be not amerced for his not appearance."

3. "That this privilege, among others, appears to be expressly reserved by the words of the last clause of the act 6 Geo. IV. c. 50, for consolidating and amending the laws relative to jurors and juries."

The resolutions were agreed to.

*Office of Clerk Assistant.*

LORDS, MONDAY, FEB. 6.—Lord *Gifford* read a letter from Mr. Cowper, stating that from infirmity he was unable to attend to discharge the duties of his office, and begged that

their lordships would be pleased to accept his resignation.—On the following day,

The Earl of *Liverpool*, after eulogizing Mr. Cowper for the manner in which he had performed the duties of Clerk Assistant for a period of forty-one years, moved a resolution,—“That this house receives with sincere concern, the resignation of Henry Cowper, Esq., on account of his health, and think it right to record the just sense they entertain of the zeal, ability, diligence, and integrity with which he executed the important duties of his office during a period of more than 40 years. Also that a humble address be presented to the King, laying before his Majesty a copy of the letter of the said Henry Cowper, Esq., and likewise the resolution of the house respecting that gentleman, and recommending him to his Majesty's Royal grace and bounty.”

The resolution was agreed to, and on

FRIDAY, FEB. 10, Lord *Gifford* reported the King's answer; by which it appeared, that his Majesty had been graciously pleased to grant Mr. Cowper a pension of 2000l. a-year.

Mr. Rose, the reading clerk, read the patent appointing William Courtenay, Esq., Clerk Assistant, in the room of Mr. Cowper; after which Mr. Courtenay was introduced, and took his seat at the table.

*Reversals of Attainder.*

TUESDAY, APRIL 25.—The Earl of *Liverpool* moved the first reading of certain bills, which were to restore James Sutherland, Esq. to the dignity and title of Baron Duffus—to restore David Ogilvy, Esq. and others, from the effects of the attainders of James, eldest son of David, Earl of Airlie; and of David Ogilvy, taking upon himself the title of Lord Ogilvy—to restore Patrick Murray Threipland, of Fingask, to the dignity of a baronet—to restore Francis Baron Wemyss and others from the effects of the attainder of David Wemyss, commonly called Lord Elcho.

These bills were read a first time, and subsequently passed.

COMMONS, TUESDAY, MAY 2.—Mr. *Peel* brought in the same bills, when

Lord *Milton* said, that if it had been stated that there could not have been a more agreeable thing than to do that which would gratify an individual, there could not be a more disagreeable thing than to feel yourself compelled to that which would have a contrary effect. He had, from the first introduction of these measures, felt that they were measures which the house ought not to sanction. It appeared to him that the grounds on which these honours had been forfeited were the strongest on which any honours conferred by the Crown could be forfeited—viz. treason; not, technically speaking, against the king, but against the constitution and liberties of the country. If the rt. hon. gent. had brought in a general bill for the reversal of all attainders, he would have gladly given it his support; but he thought it rather too much to select those whose only claim was, that they had stood in rebellion at the revolution against the liberties of the people. Why was not the Duke of Buccleuch restored to the title of the Duke of Monmouth; and why were not other indi-

viduals, who had claims to ancient baronies, restored to them, or put in the way of asserting their claims? If he should stand alone, he felt it his duty to oppose these measures: at the same time, he must declare that he knew nothing whatever to the prejudice of any of these individuals; they might, for any thing he knew, be deserving of having new honours conferred on them.

Mr. Wynn said, if the noble lord would look to the history of the country, he would see that several acts of grace had frequently passed before: it was one of the noblest prerogatives of the Crown, and it was the exer-

cise of this prerogative alone which had reconciled the country to the law of forfeiture.

Sir J. Newport could not but regret that similar instances of grace had not been shown to old Irish families.

Mr. Peel said, that a simple statement of facts would completely obviate the objections of the noble lord and the hon. bart. These measures had been commenced by the reversal of the attainder of Lord Edward Fitzgerald, and followed up by that of Lord Stafford, which he himself had brought forward.

The several bills were then read a first time, and subsequently passed.

### On Wednesday, May 31st, the Parliament was prorogued by Commission from his Majesty.

The Commons being summoned to the House of Lords in the usual form, and the commission being read, the Lord Chancellor read the following speech:—

*My Lords and Gentlemen,*

"His Majesty commands us to inform you, that the state of the public business enabling his Majesty to close the session at a period of the year the most convenient for a general election, it is his Majesty's intention to dissolve, without delay, the present Parliament, and to direct the issue of writs for the calling of a new one.

"His Majesty cannot take leave of you, without commanding us to express his Majesty's deep sense of the zeal and public spirit which you have constantly displayed in the discharge of your several important functions.

"His Majesty particularly acknowledges the promptitude and discretion with which you have applied yourselves to the objects specially recommended to you by his Majesty at the commencement of this session; and his Majesty confidently hopes that the good effect of your deliberations will be manifested in the improved stability of public and private credit.

"His Majesty has the satisfaction to inform you, that the distinguished skill, bravery, and success with which the operations of the British arms, in the dominions of the King of Ava, have been carried on, have led to the signature, upon highly honourable terms, of a preliminary treaty with that sovereign, which his Majesty has every reason to expect will be the foundation of a secure and permanent peace.

"His Majesty further commands us to repeat to you, that his Majesty's earnest endeavours have continued to be unremittingly

exerted to prevent the breaking out of hostilities among nations, and to put an end to those which still unhappily exist, as well in America as in Europe.

*Gentlemen of the House of Commons,*

"His Majesty commands us to thank you for the provision which you have made for the service of the year.

"His Majesty's attention will be constantly directed to the reduction of the public expenditure in every degree that may be consistent with the due maintenance of the security, honour, and interests of his kingdom.

*My Lords and Gentlemen,*

"We are especially commanded to assure you, that his Majesty's paternal feelings have been deeply affected by the distresses which have prevailed among the manufacturing classes of his Majesty's subjects, and by the exemplary patience with which those distresses have been generally borne.

"His Majesty trusts that the causes out of which the partial stagnation of employment has arisen, are, under the blessing of Providence, in a course of gradual abatement.

"His Majesty is confident that your presence and example in your several counties will contribute to maintain and encourage the loyal and orderly spirit which pervades the great body of his people; and his Majesty relies upon your disposition to inculcate that harmony and mutual good-will among the several great interests of the country, upon which the common prosperity of them all essentially depends."

The Lord Chancellor then signified his Majesty's royal will and pleasure, that the present Parliament be prorogued to Wednesday, the 14th day of June next; to which day it was prorogued accordingly.

# PARLIAMENTARY REVIEW.

SESSION OF 1826;—7 GEO. IV.

## IRELAND.

I. Catholic Disabilities—II. Landlords and Tenants—III. Church Establishment—IV. Law—Police—V. Tolls—VI. Corporations, &c.

WITHOUT entering at much length on the subject of Catholic Emancipation, which was little adverted to in the last Session of Parliament, it will be proper to make a few remarks on the circumstances attending this unusual reticence, as they indicate pretty plainly the nature of parliamentary morals. "All parties," said Mr. S. Rice, "whether for or against Catholic emancipation, seemed to concur in thinking that the present time was not the most favourable for the agitation of that question \*:" that is, not favourable to the success or the defeat of the measure. In 1826, the Catholics, as such, were "slaves," "out-laws," "bondsmen," and "aliens," according to their supporters; and "oath-breakers," "priest-led," "divided in their allegiance," and "rebels," according to their opponents, as much as they were in 1825, or as they will be in 1827. Why then was not 1826 a favourable time for the agitation of the question? Mr. W. J. Bankes says, "had this course (discussion) been taken on the eve of the general election, the public would have known how to choose their representatives †." The problem is here solved. Favourable, means favourable to the reelection of the old members; so that a question, described as involving the "safety and happiness of the British com-

munity at large \*" was left untouched for a whole year, because the members had apprehensions of losing their seats. One of two conclusions must be drawn. Either the supporters of the measure knew that they attached infinitely too much importance to the subject; or, believing that they were right, they left "the safety and happiness" of the community to shift for themselves, for the sake of retaining their places in parliament.

The little discussion that took place, was much of the same kind as the longer debates of the preceding session. Lord Darnley asserted "that the condition of the slaves was not so bad as that of the lowest peasantry in Ireland," owing, as we infer from the rest of his speech, to the refusal of emancipation †. Earl Grey stated that "the peace and prosperity of Ireland, and therewith the security and power of the British Empire, depended upon the question ‡." And the committee of the Lords on the state of Ireland of 1825, report that it is of "paramount importance §." We have already shown why we cannot view it in such a light. We cannot see that a removal of the disability is a necessary preparative to improvements more desirable. We cannot discover how it would benefit the body of the people in any material respect. The peasant, whether emancipated or not, (the very word is a dishonest one,) is not eligible to office, in fact. The rich would be the only *elected*, because the rich are the only electors wherever election is not

SESS. 1826.

conducted by secret suffrage. The poor man would still be as much at the mercy of landlords, tithe-gatherers, and grand jurors, and as much unprotected by the laws as now. His Protestant landlord would not treat him better, and his Catholic landlord, having no political object to gain, would, probably, treat him worse. The great evil of Ireland is its extreme poverty; but we discover no essential connexion between the removal of that and the removal of the Catholic disabilities.

We have been charged with having misrepresented the degree of consequence attached to the question by its supporters, and with having formed an erroneous estimate of its importance ourselves. The above passages, taken from the discourses of individuals, called leaders in parliament, afford a sufficient answer to the first part of this charge. As to the second, our reasoning has been met by the assertion, that—"Six millions of people think and believe that they have an interest in the removal of these disabilities; and we cannot deny that they have a right to it"—until you can convert them from this persuasion, it is in vain to argue that "substitutes will do as well or better\*." Passing by the word *right*, which flagrantly begs the question, we observe, that if the persuasion of these six millions be wrong, it is the duty of parliamentary leaders to attempt to set it right; an attempt which has never been made. On the contrary, the false importance attached to the question in Parliament is the principal cause to which the erroneous persuasion entertained out of doors is to be ascribed. *Six millions*, moreover, is a mere rhetorical flourish. Strictly, it means all the men, women, children, and babes on the Catholic side; but in effect it only means those grown-up Catholics, who take an interest in the subject, and who consist of the leaders, and the led. The led follow the leaders: gain the latter, and you gain all. It is averred on all sides, that the priests are the leaders. They were the encouragers and collectors of the Catholic rent, and the getting of money from a man's pocket affords the strongest proof of influence over his understanding. "They are," said Mr. Brougham, "the natural instructors of the people," and he confessed that he was fearful of *their being influenced* by the government, had the

provision proposed for them last year been made. If the priests can teach, they can also unteach these wrong opinions. To induce them to unteach these opinions, it is only necessary to give them an interest in doing so—to submit them to that influence, of which so much apprehension is expressed.—As to the further assertion that we support these views for the mere sake of differing with the advocates of emancipation, and showing that nobody is in the right but ourselves, the writer who can have recourse to such a charge unsupported by the slightest attempt at proof, admits to that extent that he is unable to furnish any substantial answer to the arguments with which we have supported our opinion.

II. The committee of the House of Lords on the state of Ireland made their report at the end of the session of 1825†. They enter on various topics, and suggest numerous alterations, some of which were the subject of debate during last session.

One of the subjects most prominently adverted to in the report, is the number of persons intervening in Ireland between the head landlord and the occupying tenant. The Irish *middleman* has been the object of much loose animadversion. A middleman is a person who hires land of the landlord to re-let it at an increased rent to under-tenants. Letting to middlemen is a plan adopted by landlords who dislike to employ agents, or whose property is incumbered with a large population, holding the land sometimes in several tenancy, at other times in partnerships, as the old Irish did under the Brehon law. The landlord finds it disagreeable to deal with a numerous tenantry himself, and an agent has not a sufficiently strong interest to wade through the difficulty of collecting the rent from them. A middleman is resorted to, because he has an interest in using the proper means. According to Mr. L. Foster, "the middleman has his eye continually on the tenantry; he watches with a jealous eye each individual pig and firkin of butter; he follows the tenant to the market‡."—The first charge made against middlemen is the extortion of high rents. How they can extort higher rents than the tenants offer to pay, or why the landlords by them-

\* Edinb. Review, vol. xlv. p. 472.

† Parl. Abstracts, *Sess.* 1826, p. 1. (Comment—*Ireland*—No. 40. 1826).

‡ Lords' Com. 1825, Ev. p. 57.

selves or their agents, will not *extort* high rents, if they can, as well as the middlemen, it is not easy to discover.—Another charge is, that they *job* in land; that they are *land-sharks*; the interpretation of which is, that they hire land for the purpose of under-letting it as high as they can; and if they can get increased rents from new tenants, they turn out the old ones, who hold in effect at will, being too poor to pay for stamps on the written leases which are handed to them. It is not said that landlords and agents do not turn out tenants in the same way; as they have the same interest to do so as the middlemen, they most likely do it; in fact, there is positive evidence that they do. In England tenants are not turned out so unceremoniously, because they are rich enough to pay for stamps, and the removal of their capital, by throwing the land out of its course, would be *mischievous* to the soil. In Ireland the tenant has neither stamped lease, capital, nor courses of cultivation. *Land-jobbing* is produced neither by middlemen nor landlords. It necessarily attends the continual demand for, and increase in, the *rent* of land, resulting from the continual *increase* of an impoverished population. If rents were stationary or falling, tenants would remain in possession, and land-jobbing would disappear.—It has been said that if there were no middlemen, there would be fewer absentees. We shall not discuss the general benefit of a resident nobility and gentry, nor inquire particularly into the 'good done to the farming labourers in England, by the neighbourhood of nobles and esquires, with the game-laws, and justice-laws. Suffice it to say, that middlemen are not of the aristocratic classes, being only *squireens*; they have no exclusive right to the game, and produce no poachers; but they are said, by a man of sense and experience, to be in many districts, mainly instrumental in keeping the peasantry quiet\*. With respect to the good commonly supposed to result to the community from the landlords spending their rents on their estates, the point, we believe, may be settled in a few words.—If their incomes be spent in eating, drinking, dressing, and the like; if they be *consumed*, it can signify nothing ultimately where that consumption takes place. If on the estates, then part of the incomes goes to pay for bread, meat,

and other home commodities, and the rest for wine, tea, and other foreign ones; for which another portion of home commodities must have been already given, by the persons who sell to the landlord. If the incomes be spent abroad, then the money transmitted, whether coin or bills, must have been paid for by an equivalent quantity of home commodities. The incomes are, in both cases, *consumed*. If, instead of consuming, absentees *accumulated* their incomes; if they built barns, drained lands, and the like, it would be better for the community that they remained at home. But landlords, especially Irish landlords, are universally thriftless.—A fourth charge against the system of middlemen is, that every middleman can, as well as the landlord, distrain upon the occupier. So he can in England; and in Ireland the same law exists for the protection of the tenant as in England; viz.—if the head landlord distrain for his rent, the occupying tenant is at liberty to take credit for it against the intermediate landlord. The grievance is not in the system of middlemen, but in judicial procedure, which is so inordinately dear, that the tenant, when wronged, cannot purchase the remedy held out by the law.

If we rightly understand the Report, there is an endeavour made to connect the system of middlemen with the other great point to which it adverts, the subdivision of the land. The cause of the subdivision of land is, as we stated in our volume of last year\*, the want of a tenantry with capitals large enough to take larger quantities. There is no demand for labour: they who would labour are therefore obliged to take patches of land to subsist on, and in proportion as the population increases, the patches become smaller and smaller. The only evil of the subdivision is, that it prevents accumulation of capital: a great evil, undoubtedly; but the sufficiency of the remedy which has been applied, seems at least questionable. An Act of last session† prohibits the underletting of land without the head landlord's consent. Such a law may prevent land from being underlet to such poor tenants as the landlord does not like; but it will not prevent him from letting it himself to such as he does. The law is founded upon the supposition that landlords have an inclination to prevent the

\* Commons' Com. Ev. 1824, p. 14. Mr. Blackburne.

\* Page 620.

† 7 Geo. IV. cap. 29.

subdivision of their estates, which can scarcely be regarded as perfectly certain. If many poor tenants paid a greater rent, collectively, than one rich one, the landlord would prefer them; he would push the subdivision of his land, until stopped by the illegal combination, and resistance of numbers. This resistance, it is well known, has occurred; it has been one of the objects of Captain Rock, and the Ribbonmen; and has been followed by a panic on the part of the landlords, which, for the moment, makes them regard the numerousness of their tenantry, (abstracted from their resistance,) as the evil. They now raise their voices for tenants with capital, and the law has been passed as an instrument by which to obtain them. It is, however, at least, a subject of doubt, whether agricultural capital would yield so much rent, as the mere manual labour now applied. The point might, perhaps, be decided by comparing rents in Ireland at present with those in England. The evidence on the subject, though not strong, is enough to raise a doubt whether the new law, or any other, will avail to prevent subdivision of land.

It has been proposed to prohibit the letting of land under a certain quantity (from fifty acres, or upwards, to one hundred). It would require the concurrence of both landlord and tenant to carry such a law into effect: the latter, it is obvious, would not give his concurrence, and the law could be easily evaded by partnerships, or by interposing a nominal lessee. But could it be carried into execution? and when? If immediately, four-fifths of the population would die of starvation, and the landlords be left without tenants. So they would if it were carried into effect as the existing leases dropped in. Mr. L. Foster says, that such of the peasantry as have been turned away by landlords, who are "clearing" their estates, under the influence of the panic, resort to the large towns, where they endure the most frightful privations, vast numbers living by begging\*. Can it be supposed that this will always be continued? The peasantry may quit possession, and starve: but it is infinitely more probable that they will resist the efforts made to turn them away, if persevered in to any great extent.

It must not be inferred from the foregoing argument that capital can never

be introduced into Irish agriculture, or that the subdivisions will continue for ever. Capital will find its way, whenever the Government shall be able to repress disorder; and the subdivisions will cease whenever the peasantry find that they can gain more by taking wages from the capitalist than by hiring land. The landlord, in such case, must resort to the rich tenant, whether willingly or not, or have his land untenanted; and the rich tenant will take it in large quantities.

It is important to explain the fallacies at the bottom of nearly all the discussion on the subject of subdividing the land. Subdivision is the effect, not the cause, of poverty; nor would the existence of capital be necessarily the cause of the well-being of the peasantry. Their wages must be determined by their numbers, which might become so great that they would get even less by wages, than they do by hiring land; for so reason can be shewn why a peasant should not beget as many children, when working in the field of a rich farmer, as when digging his own potatoe-plot. Increase of capital may afford him a better maintenance for a time, but not permanently. To effect that, he must be taught to limit his numbers: and it is lamentable to witness the efforts of influential persons in Ireland to decry this all-important truth.

III. The main point relating to the Irish Church Establishment—Tithes—was not particularly noticed during the session: but some discussion was raised on the subject of first fruits\*. During the dominion of the papacy, two taxes were paid from church-property to the pope. One was called the *primitia*, *annates*, or first fruits, and was the first year's profit of every ecclesiastical benefice on the admission of a new incumbent. The other was the twentieths, or the twentieth part of the yearly income. These taxes were received by the crown subsequently to the Reformation until the time of Queen Anne, when the twentieths were given up altogether; and the first fruits, then averaging 450l. per annum, were vested in trustees, for the purpose of building and repairing churches and parsonage-houses, purchasing glebes, and increasing the incomes of the poor clergy. The fair meaning of the patent was, that the first year's actual profit should be taken; but, unfortunately, a clause to appoint valuations, from time to

\* Lords' Com. 1825, Ev. p. 56.

\* *Ante*, p. 40.

time, as the value of corn might vary, was omitted; and the consequence has been, that the Irish clergy have successfully maintained, that the benefices are liable to pay no more than the same amount in money which they paid at the date of the grant. The recent Irish Tithe Composition Act has given us an opportunity of judging of the extent of the abuse. In one diocese there are 95 livings, 25 of which, alone, yield 10,580*l.* a year, and yet the first fruits of the whole, amount only to 258*l.* 12*s.* \*. Since the Union, 700,000*l.* have been granted by Parliament in aid of the first fruits; but our readers will see, on referring to any works on the state of the Irish church, that, notwithstanding this enormous aid, there are at present a vast number of livings, either without glebe or parsonage-house, or so poor as to afford a very insufficient income; and, for the purpose of meeting this disastrous poverty, the Privy Council, and also the bishops, are allowed, by law, to unite two, three, or more parishes together, which power has been pushed to an extraordinary extent. The parishes thus united form large tracts of country, frequently fifteen or twenty miles long, which renders a proper performance of the clerical duties impossible; and notwithstanding the unions, a large portion of the clergy are non-resident for want of dwellings. The churches, such as they are, are kept from falling to pieces by the church-rates, which are paid for the most part by Catholics, who, nevertheless, can take no part in levying or spending them†. And as if this were not enough, there is actually a great and unsatisfied demand for more churches; for, at a meeting of the Irish Board of First Fruits, in February, 1825, the demands of the Church of Ireland on the Board, amounted to 100,000*l.*—although the return which it was compelled to make was a cypher‡. The proposition made to Parliament was, that the real amount of the first year's income should be taken. This proposition was opposed by such arguments as the following. 1. It involved the interests not only of the clergy, but of many orders in the state; it was an attack on the church, and would lead to an attack on other interests§—the old fallacy of *distrust*, which only requires naming to be scouted. 2. The

First Fruits were originally a papal usurpation, and to receive the whole year's income would be in principle, to justify papal usurpation\*.—To receive part is as much within such a principle as to receive all; and if an application to the church of the part, according to the speaker, take away its popish nature, so would an application of the whole. Moreover, because an impost was raised for a bad purpose many centuries ago, does it follow that it should not be continued for a good one now? 3. The law, which gave the papal property to the crown (Stat. H. VIII.), gave no right to make a new valuation of benefices†.—Laws are not irrevocable. Permanency is given to the laws of property where it is expedient, but not under circumstances where it would be inexpedient. It is not the antiquity, but the utility, of a law which ought to determine its existence. 4. Rents held under feudal tenants (quit-rents) would require alteration on the same ground‡.—They would not require alteration, and the ground on which they are sustained is not the same. By changing them, the few would be benefited at the expense of the many: by changing the first fruits, the many would be benefited, not indeed at the expense of the few; but to the injury of none. Quit-rents and first fruits are alike only in being old; in all other respects they differ. 5. Another argument is the same that is invariably met with in discussions upon church property.—The measure would be a *wringing* of funds from the establishment—from the church§.—But from what or whom? Not from the church, because the church in this sense means nothing but the parsons, (to use the legal appellation,) who *use* the property; and the proposal does not seek to oblige the present parsons to pay a full year's dividend; it extends only to the future ones, to whom it cannot do injustice; for they are not yet in possession, and only a few of them at present parsons in *posse*. If a parson could leave his benefice to his heir or his devisee, the case would be altered; but it goes altogether to a stranger. The rule might have an effect on the value of saleable advowsons; but their number is small, and they might, and ought to be, exempted from the operation of the law. 6. Another argument was, that Religion

(meaning the Protestant one) was for the benefit of all, and therefore all ought to contribute to building churches\*. The Protestant religion with its tithes, church-rates, and exclusions, beneficial to the Catholics! to the Catholic majority! The Protestant religion beneficial to the Catholics of the parish of Aghadoe, where the Catholics are 300 to 1, and where they are called on to build a church for Mr. Grierson, the Protestant clergyman†! 7. It is difficult to be serious when our eyes or ears are assailed by such a sentence as the following:—"It might as well be maintained that the great public functionaries should pay for the erection of public offices, or that soldiers should defray the expense of building and repairing the barracks in which they are quartered‡." Unfortunately for the foundation of this reasoning, the parsons *do* render a part of their pay, for their churches and parsonages, (offices and barracks,) and it is only proposed to make the future ones pay a proper part. If this, however, were not the case, it would be doubtless hard upon Mr. Goulburn to make him build his own office; but it would not be hard upon his son, who may become a secretary, but who also may become any thing else.— 8. The last objection that "the measure would reduce the clergy to debtors and paupers§," is too absurd to demand exposure.

The next measure connected with the Irish church was a law to regulate the assessment and spending of church rates. Various abuses exist; for which we refer our readers to the speech of Sir John Newport||, and a motion of the same gentleman in 1825¶. The main reason for the abuses has been already adverted to, viz. the exclusive privilege of the Protestant parishioners to assess and spend the money, and the want of a power to appeal to a proper court. The appeal is granted by the new law\*\*, but the exclusion of the Catholics from the office of churchwarden, is retained. The latter circumstance, during a debate on another subject, afforded one of the strangest arguments we ever remember meeting with. It was proposed to extend Mr. Peel's New Jury Bill to Ireland, a proposal which it would be

difficult to find a sound reason for resisting. But the Church Rates Act yielded the following precious trifling:—

"The basis of that bill (the Jury Bill) consisted of returns of jurors made by overseers of the poor and churchwardens. Now, in Ireland, they had no overseers of the poor; and as to returns made by churchwardens, the hon. bart. (Sir J. Newport) would not like to see returns of jurors made by men holding an office from which Roman Catholics are excluded\*." Did it not occur to Mr. Plunkett that the "basis" might be kept undisturbed by allowing one of the churchwardens to be a Catholic: or that the "basis" would be as good, if other returning-officers were appointed?

The only remarkable circumstance attending the new Church Rate Act was a proposition for a clause to empower vestries to raise sums to build and repair Catholic and Presbyterian Chapels‡. It appears to have been hitherto the practice of vestries to lay out money on Catholic chapels, but without legal authority. This was found useful, because the Catholic chapels are so insufficient that a large part of the congregation is obliged to kneel outside the doors, and it tended to lessen the discontent, which the exclusive object and management of the rate, according to the statutes, naturally excited. Where no such assessment is made, the Protestant inhabitants subscribe voluntarily for the same purpose. The proposition was therefore made under the most favourable circumstances. The main reason with which it was opposed was, that it was an "impropriety" to assess a parish for any place of worship contrary to the Established Church†. Not the slightest attempt was made to shew why, or to explain what was meant. Mr. Peel very properly stated that the provision for the Presbyterians was merely colourable. It would undoubtedly have been more candid in Mr. S. Rice, who made the proposition, to state its real object; but it was quite as unfair in Mr. Peel to contend that since it included the Presbyterians, and did not include the Quakers and Methodists, he must oppose its being extended to the Catholics§. The Presbyterians, Quakers, and Methodists need not be included, because there are no reasons of expediency for including them; but it is very expedient to make

such a provision for the Catholics, as we have seen above.

The remaining topic was the Episcopal Unions. If it be useful to have an establishment supported out of an extensive public property, its object would be greatly promoted by an equal distribution, according to population and place. If many parishes are lumped together with only one church, a portion of the parishioners, and probably a large one, will be prevented from going to church by the distance; if with a church in each parish, each parish will be visited by the clergyman too seldom. The clergyman will, moreover, be too rich to be a good one. In Ireland, the Protestant clergy are supported in the main by persons who are discontented, because they are very poor and of another creed; an improper performance of his duty on the part of the clergyman will obviously increase that feeling. With these positions in our recollection, we may judge how far the

Irish clergy are inclined to promote the object of their church, and how much weight there is in one of the arguments against meddling with the church property, viz. that the latter is only a proper reward for the performance of the sacred duties.

The glebe lands in Ireland amount to 83,000 acres; and, according to Mr. L. Foster, are worth about 20s. per acre. This income is in addition to the tithes, which it is important to bear in mind. In 1825, Mr. Foster delivered in a list of the incomes of the 368 parishes in which the Composition Act had been put into force, distinguishing such of them as were united to others\*. Unfortunately, this document seldom states either the amount derived from the parishes united, or their names. We have taken some pains to make out the following table, and request the reader to give it a careful perusal.

\* Lords' Com. 1825, p. 603.

| Diocese.    | Parishes.                       | Tithes of each.     | United Tithes. | Other Parishes also united, but Tithes not stated. |

Have any of our readers had the fortune to meet with such proofs of disregard of duty, rapacity, and contempt of the discontented, tithe-paying Catholics, as this list exhibits? It is needless to add comments; we only beg the reader to recollect what we have already said on the subject of first fruits; and that this is the Church of which property is so sacred that a proposition to interfere with it has been pronounced by Mr. Canning to be the *basest* proposition that could be submitted to a legislative assembly\*.

IV. When complaints are made of laws, it often happens that the grievance

complained of is occasioned not by the law, but by the abuse of it. The law giving the landlord power to *distrain* for rent and to eject, are subjects of much complaint in Ireland. Without affirming that a better security might not be given to the landlord than the power of *distrain*, it may at least be doubted whether such security must not include a power lodged somewhere to seize the effects of the tenant *summarily*, as often as his rent is in *arrear*. The law arose out of the practice in ancient times of paying the rent in kind from each year's produce, which the landlord could not have enforced without an authority to take it, before the tenant could find time to carry his produce away. The necessity of the law is therefore proportioned to the poverty of the

\* Parl. Hist. and Review, Sess. 1825, pp. 370, 626.

tenant. In Ireland he is so poor, that if the produce were taken away, the landlord would remain wholly unpaid. The policy of the power to eject tenants from possession, is obvious. As in Ireland the tenants frequently combine to resist the payment of their rents, the power to eject is more necessary there than elsewhere. Both laws are greatly abused; the evidence before the committees establishes the fact beyond all doubt; and the abuses of both might, we believe, to some extent, be cured by a few new provisions, as we shall shew hereafter. But the best security would be to cheapen the legal remedies against abuse. Procedure is in all countries expensive; but in Ireland it is so expensive as to be entirely out of the reach of the poor. To use the language of Mr. Martin, "though the law may be equally administered in Ireland, it is not accessible, any more than the City of London Tavern, to those who have no money\*."

However, since the interests and prejudices of the rich will probably long stand in the way of such a reform, we must look for the next best that can be had. The abuse of the power of distraint might, perhaps, be lessened by obliging the landlord previously to establish his claim, and its amount, before some judicial officer; such a step would not affect the necessary dispatch; and it would be better that the distress were executed by bailiffs publicly appointed, and not by any person whom the landlord may delegate, as at present. With respect to the hardship resulting from the intervening, as well as head, landlord's power to distraint, it has been proposed to prevent the middleman from distraining until he has paid his own rent to the landlord. But such a law would be inefficient; for as he acts now in defiance of the tenant's right of set-off, he would not scruple to act in defiance of an absolute inhibition. If he were bound to prove before some judicial officer his payment to the landlord, the abuse in question might likewise be diminished; but to give an available protection to the tenant, against the landlord, in consequence of the middleman being in default, the tenant must be empowered to pay the landlord judicially, and the middleman be prevented by the officer in question from distraining for more than the balance. The abuse, however, will not be greatly diminished: for what is to prevent

the landlord or the middleman from distraining for more than they are judicially authorized to do?

The abuses of the law of ejectment arise out of the Civil Bill procedure, the consideration of which we must defer, until the report promised by Lord Liverpool shall be presented to the House\*.

For the present, however, we may observe, that integrity is as essential an element in the composition of a tribunal as cheapness; and it is not always easy to combine integrity with cheapness. The *Manor Courts* unite to a great degree dispatch with cheapness in their procedure; but they possess no security against corruption. The stewards, or seneschals, are, in the greatest number of instances, persons without character,—according to Mr. O'Connell, hedge-schoolmasters, or drivers to estates; for their courts are in such bad odour, that respectable persons can seldom be prevailed upon to accept the office. The consequence is that they lend themselves to every kind of abuse. They have fees on every suit; and in order to increase suits, they permit a single debt to be split into several causes of action; a debt of one pound being sometimes divided into four debts of five shillings each. Their bailiffs make seizures, without rendering the amount to the proper parties, and the juries take bribes of whiskey, because there is no power to prevent them. The only remedy yet given for these abuses is, that the seneschal is now obliged to enter into a security, with two sureties, to perform his duties "truly and faithfully†." The remedy is a mere mockery to the peasantry. To make it available, they must sue the steward in one of the courts of law; and the courts of law are altogether out of their reach. There is no reason given on the score of *vested rights*, why the Manor Courts should not be altogether abolished, and their jurisdiction added to the Civil Bill Courts. Jurisdictions of the same nature existed in Scotland, not more than eighty years since, and were abolished by the legislature.

With the subject of judicial integrity is connected the offices of sheriff and undersheriff. The main defect in the former is, that the sheriff has no control over the malpractices of his undersheriff. And with respect to the latter, it is executed with such effrontery of corruption as nearly

\* *Ante*, p. 31.

† Stat. 7, Geo. IV. cap. 41.

to exceed belief. The reader is, doubtless, aware that the most important functions of undersheriffs are to arrest debtors at the commencement of suits, and to capture their persons, or seize their property for the satisfaction of debts, if judgment be awarded against them. To proceed by arrest in Ireland, is either nugatory or accompanied by great expense. There is no bailiff to execute the arrest; the plaintiff is therefore obliged to employ a person for the purpose, for which he must indemnify the sheriff, or rather, in practice, the undersheriff, against loss from his malfeasance—and also pay an extra fee, or a poundage on the amount of the debt. The undersheriff gives himself very little trouble in the arrest; for, as the debtor will frequently pay the debt at once, rather than expose his situation, by applying to his friends for bail, the undersheriff loses the profit of final execution, which he would gain if the defendant, from being sued without arrest, should proceed to resist the claim for the purpose of delay. But if the undersheriff can be induced to make an effort to execute the arrest, the plaintiff must bid a higher price than the defendant will give for an intimation to keep out of the way. The *douceur* from the plaintiff sometimes amounts to a hundred pounds. It is not, however, till after judgment that the power of the undersheriff is most abused. A plaintiff has two ways of proceeding to get satisfaction. He may take the defendant and shut him up in prison until he pays the debt, or he may seize and sell his effects. If he proceed by capture, he gives the writ of execution to the undersheriff, by which the latter is ordered to take the defendant's person immediately, in order that the debt may be satisfied. The object of the undersheriff is profit; the plaintiff must, therefore, outbid the defendant, as in the case of arrest; but as it is much more common for the defendant to reside within the undersheriff's county, than the plaintiff, who, in many cases, must be a stranger, the undersheriff generally leans to the defendant, because, if he have more affairs of the same kind, he will be a better *customer* than the plaintiff; if the defendant be in embarrassed circumstances, the undersheriff will prefer him without fail, so that the difficulty of securing his person increases in proportion as it becomes necessary. If the plaintiff proceed by seizure of the defendant's effects, the undersheriff is ordered to make up the amount

of the debt immediately from them. Sometimes the undersheriff will refuse to do his duty without a *douceur* paid down or stipulated; if none be proposed at first, he will raise the money, and decline to pay it over, without one. In this case, the plaintiff must again outbid the defendant. If the plaintiff pray the court to punish the undersheriff for the abuse, by a process, called attachment, the undersheriff may discharge himself by affidavit; and if the plaintiff resort to an action at law, he sues at the risk of paying treble costs in the event of failing, and of being outsworn by such persons as sheriffs' officers, and their deputies. In England, besides the power of the tribunals to punish, and the strength of public opinion, an undersheriff is prevented from abusing writs of execution, by the circumstance of not holding his office for more than a year, which makes him execute them without delay, in order to get the profits within his year; but in Ireland, as the undersheriff continues in office for life, under the names of other parties, he has time to draw the profit of delay; delay, in fact, bounded only by the defendant's ceasing to be a profitable customer. The evil resulting from these abuses is serious indeed. The capitalist or the merchant, finding that he has no security for his debt, ceases to give credit: the country suffers from a want of the money of the capitalist, and the commodities of the merchant; and the peasant's employment is diminished. The commissioners from whose report we extract some of the foregoing details, suggest as the main remedy, the attribution of all the functions of the undersheriff connected with the courts to a permanent officer, like the sheriff-depute in Scotland, who should be particularly under their control, and be bound in sureties to perform his duties properly. The suggestion must, we think, be approved of, although we feel inclined to doubt whether the annual removal of the undersheriff from office, would not afford a better security, by the interest it would give him in a proper performance of his functions. Permanent officers may get favour with the judges—they will be looked on as part of the courts themselves—their appointments will, perhaps, fall into the hands of the judges; and, unfortunately, there is no public opinion in Ireland strong enough to correct such defects.

The subject of *Police* in Ireland is, perhaps, of all others that which calls for

the gravest attention at the present moment. The good to be effected, must grow up by degrees. The introduction of capital, the establishment of proper education, and the creation of habits of industry and order, call for time; but still more for tranquillity and safety. This is not the place for entering into the general question of an unpaid magistracy; suffice it to say, that as in Ireland the poverty and ignorance of the peasantry make it more difficult to rule them, and at the same time give greater scope to abuse, the defects of such a magistracy, on the score of want of the necessary talents, zeal, and responsibility, are more particularly felt. The evidence before the committees shews, amongst other things, that the late *epuration* has left many magistrates still in the commission altogether unworthy of their office; being either persons without character, or quite uneducated and ignorant. It is a common habit with such magistrates to receive presents in fowls, potatoes, and even money; some, who would not venture so far, get unpaid harvest-work, turf-cutting, and the like, from the suitors. Sometimes they lend themselves to oppression, by summoning parties to appear before them at great distances from home, or several times, without appearing themselves; men have been even committed to prison, as felons, for non-performance of bargains, or for refusing to quit possession of their houses. To the magistrates may be joined the *Grand Juries*, whose corrupt waste of the money raised for county purposes, is notorious; but we must wait for the measure mentioned by Lord Liverpool before we enter into the subject.

With respect to the extraordinary instrument of police, called the Insurrection Act, it is a matter of great difficulty to judge of its fitness for the end in view. Its name leads to a misapprehension of its purpose; which is not so much the prevention of insurrection, or outrages committed by numbers, as to put a stop to burnings, houghing cattle, and posting menacing notices; acts that can be all done without combination. The combinations of the peasantry have, in fact, been exceedingly few, compared with the notion commonly entertained of them. The attack on the police station, at Glanisheen, in April 1823, was made, at the utmost, by a hundred persons. The combinations of the English peasantry for the purpose of poaching, appear to be more numerous and frequent. The crimes of burning, hough-

ing cattle, and the like, can be committed by single persons, and in the night, and as the great body of the peasantry is disposed to the commission of such offences, discovery of the offenders is nearly impossible. To shut all persons up in their houses during the whole night, and, by order of a bench of magistrates, to transport such as are seen abroad, are certainly very powerful means of prevention. But a great deduction must be made for the evil contained in the remedy. It is a great evil to the well-disposed to be kept at home all the night, and great injustice must be done by the magistrates who try the offenders. All that can be fairly said upon it is, that considering the great present mischief, and the still greater future evil from the alarm of capitalists, which the law was made to prevent, the power is not too great; but, looking at the persons who are appointed to execute it, it must be allowed that great mischief must arise from its exercise. One thing, however, ought to be remarked; none of those who complain of the law, suggest any remedy for it—applicable, we mean, to the actual state of things. Some immediate remedy is necessary, and it is better to seek for one, than merely to condemn the existing regulation.

V. Amongst other subjects connected with the parliamentary inquiry concerning Ireland, was the subject of *Tolls*. A toll is a tax; and every tax, abstracted from any consideration of the services for which it is raised, is an evil to the community. The only circumstances which counter-balance the evil, are either the services, or some right of property. Tolls are raised for the maintenance of roads, bridges, market-places, harbours, the expenses of corporations, and the like, and perhaps it is better to support these by tolls, than by deductions from the taxes levied by the Government. Tolls belonging to particular persons follow the course of other property, and must not be touched without compensation; but those belonging to corporations, for which no services are rendered, might be, and ought to be swept off, saving only the claims of creditors. The defect in the proper tolls, is the great difficulty of preventing extortion. The common law, as it is called, says, that "even were outrageous tolls granted *with a fair and market*, the grant would be void\*." The

and the statutes upon the subject exempt turf, furze, timber for fuel, and articles connected with the manufacture of linen from toll, and oblige the weighing masters at markets and fairs to weigh potatoes gratuitously\*. But it appears from all the returns made to the clerk of the peace in one of the largest counties in Ireland, that the tolls levied on corn, potatoes, oatmeal, fresh butter, flannels, friezes, coarse woollens and linens, amount to five per cent. *ad valorem*; and as if such an impost *once* imposed were not grievous enough, it is levied a second time on the same articles, if afterwards sold by retail. The law, too, is not only violated in respect of the "outrageousness" of the tolls, it is actually disregarded with respect to articles exempted; for in several cases, claim of toll on turf and furze is specifically made; and a general toll on wood and timber is made to timber for fuel. Flax, yarn, linens, bandle-cloth, cottons, kelp, ashes, and flax-seed, wheels, reels, and hackles, are sometimes specifically charged with toll; at others, they are included in the lists of tolls, as "articles sold by the yard"—"bale-goods"—"turned and wooden ware," &c. These are but a small part of the abuses; we refer the reader to the Report of the Select Committee, if he desire to become acquainted with the whole†. This subject is manifestly a grave one, when it is considered that numerous or exorbitant tolls may be a great check upon industry, especially the industry of the poor, and that it affects articles of such serious importance as *potatoes and turf*. The annual amount collected, by some calculated at 500,000l.‡ and by others at a million§, renders it serious; but the way in which it was handled in the House of Commons, proves very little in favour of that body. A more accurate inquiry was moved for by Mr. S. Rice than has hitherto been made, which appears to be without objection; but the proposition was met by such reasons as the following:

1. The objection of tolls obstructing industry, applied to Covent-garden market, and to towns in England §:—which is only a reason for curing it in England also.
2. The like disorders arise from resistance

to demands for rent and tithes as for tolls\*. But by curing the defects in the tolls, the disorders would be so far lessened, and, to use the fallacy of *precedent*, since a remedy has been devised to cure the disorders arising from improper demand or extortion of rent and tithes, for the same reason, let one be made for tolls. 3. The gentlemen of the neighbourhood ought to make an example of the offenders\*. Why is there reason for supposing that they will do so in future, seeing that they have hitherto done nothing? 4. The inquiry would be Herculean†. Take then the necessary Herculean talents, and proper time. 5. If tolls were so extravagantly high, the country gentlemen, out of whose pockets they must be principally paid, would not fail to make the grievance known, so as to reach the ear of Government‡. Now it is just because tolls do *not* fall on the country gentlemen, but on the poor feeders upon potatoes, and weavers of Irish linen, that the grievance is not known. By Government, Mr. Plunkett, who made the last remark, meant himself as Attorney-General. Mr. Fitzgerald well answered it in another way. "He wished Mr. Rice could prevail on Mr. Goulburn to take up the matter sincerely; though he never knew a secretary of Ireland who knew much of that country, nor a great lawyer who knew much of any country§." From the strong opposition, and the feeble arguments with which Mr. Rice's proposition was met, we should feel inclined to infer, that there is more importance in the subject than has been disclosed; unless indeed, the Irish Government opposed it from mere indolence.

VI. On the subject of *Corporations*, mentioned particularly by many of the witnesses, there is but little to be said. It is not easy to see any connexion between the good of the community at large, and the unjust exclusion of a few Catholics from the freedom of boroughs, or the depriving non-resident voters of their right of suffrage at elections. The subject is scarcely worth inquiry.—As to the administration of justice in corporations, we know no peculiar advantage in it, which should prevent their jurisdictions from being made over to the Civil Bill Court.

\* 4 Anne, cap. 8—25 Geo. II. cap. 15—1 Geo. III. cap. 17—11 and 12 Geo. III. cap. 31—32 Geo. III. cap. 29—37 Geo. III. cap. 188.

far as such claims are concerned as that tribunal decides; and as to actions of importance, we know from experience in England, that they become so constantly the subject of appeal to the higher courts, that it would be better to deprive the corporations of their jurisdiction altogether. The powers of magistracy and police are generally executed as improperly by corporations as by the county magistracy; with the further impropriety of being much more frequently abused for the purposes of local and political parties.

The subject of the forty-shilling freeholders is worth adverting to, more on account of what has occurred out of parliament than in it, since the publication of our last volume. The reader will recollect, that at the last general election, the forty-shilling freeholders of two or three counties voted for candidates favourable to emancipation, contrary to the wishes of their landlords. The fact proves but little in favour of the institution; for there is reason to believe that they relied for protection on the Catholic Association. But as the Catholic Association cannot exist for ever, their independence, as it is termed, will cease with it. The most remarkable circumstance was the plainness with which some of the newspapers, and other publications, condemned the proceedings of the peasantry as "a desertion of their natural allegiance to their landlords." Not to enter into the real meaning of the phrase, the theory of *natural allegiance* must sometimes lead to an awkward result. If natural allegiance make a tenant vote for a tory candidate to-day, it may also oblige him to vote for a whig candidate to-morrow in the next county. This is only one of the absurdities, which the theory involves. Such is always the consequence where utility is lost sight of; or when men attempt to combine partial with general interests.

There is a vague feeling of apprehension very generally prevailing, at present, on the subject of disturbances in Ireland, which requires some notice. The fears as to the potatoe-crop have ceased, and the public papers contain but few accounts of disturbance. The only evidence that exists, is the intemperate conduct of a few Orangemen, and the activity and violence of the Catholic Association and its leaders. The Orange speeches prove but little; for their makers can have no more ground for expecting disturbance than ourselves, nor can excite much additional exasperation

by what they say; and although the Catholic Association be active in collecting its rent, and the leaders make fiery harangues, we cannot conceive that enough rent will be collected to do any mischief with, or that the interests of the leaders would lead them to do it. The mischief apprehended is an insurrection—an insurrection of the Catholics against the Protestants. Now, it is impossible to suppose, that the mischiefs of such a proceeding have not been calculated. The leaders cannot suppose that the Government would be wise enough to yield in time, or even if it were, that it would not be obliged to resist by the importunity of the Protestants. The success of an insurrection is so infinitely improbable, considering the strength of the Government, and the want of means in the insurgents, (the Insurrection Act having disarmed the peasantry,) that the punishment or ruin of the leaders must be looked upon as nearly certain. Such amongst the latter as have the benefit of the peasantry at heart, must moreover see, that besides the immediate evils of defeat and disturbance, the objects they have in view would be placed more than ever, beyond their reach, in the event of an unsuccessful struggle. Why then, it may be asked, is such menacing language held in the Association? First, from mere folly and excitement: chiefly, perhaps, with a view to frighten the legislature into a removal of the Catholic disabilities.

## FOREIGN DEPENDENCIES.

I. *Negro Slavery.*—II. *Slave-Trade.*  
—III. *Sierra Leone.*

It will be in the reader's memory, that the resolutions of the House of Commons on the subject of Negro Slavery\*—resolutions afterwards adopted by the House of Lords—were moved by a member of the Government, for the purpose of superseding a proposition from a warm supporter of Negro emancipation (Mr. Buxton,) which declared that slavery ought to be abolished on the grounds of its repugnancy "to the principles of the British Constitution, and of the Christian religion." We shall content ourselves with referring the reader to the discourses of Mr. Canning†, and Lord Dudley and Ward‡, for informa-

\* Parl. Review, *Sess.* 1825, p. 641. *Vid. et ante*, p. 76.

† *Ante*, p. 76.

‡ — p. 102.

tion on the subject of these two propositions, as their remarks appear to contain nearly all that can be said on the subject. The graver point, in Mr. Buxton's proceeding, was the circumstance of referring the question to a religious dogma, and not to expediency. Expediency lets in considerations of the means as well as the end; but a dogma, and particularly a religious one, excludes all consideration of the nature of the means. If the institution of slavery—if the keeping a slave—be repugnant to the Christian religion; if the toleration of slavery be a *sin*; if the keeper of a slave incur the penalties of religion, as he must do, if the institution be sinful, it follows that all considerations of the worldly welfare of the masters and of ourselves, as connected with the existence of slavery, must *immediately* give way: otherwise there is a fallacy in the doctrine which teaches that our religious interests are *infinitely* greater than our worldly ones. Lord Calthorpe's explanation of the resolution is manifestly inconsistent\*. If the abolition be gradual, *because* due regard must be paid to the master's interests, the master's worldly interests are preferred to the heavenly ones of himself, and of us, who tolerate slavery. In short, the supporters of Mr. Buxton's resolution must be held to regard the planters, their supporters, and such of their opponents as are willing to give them time, as regardless of their religious interests; as wagering property and power against posthumous punishment.

But as it is clear, from the manner in which he proposes to act, that Mr. Buxton neither would, nor could, follow up his resolution to the letter; his notions must, in fact, be bottomed on a vague perception of expediency. His resolution, accordingly, is only to be regarded as a sign of the *spirit* with which he would act; and it should seem as if he had but loosely calculated the consequences of what he proposes, in a matter requiring the exercise of so much deliberation.

Mr. Buxton, however, does not stand alone; he is supported by many members of both Houses, and by many well-intentioned people out of doors; he possesses a very active body of coadjutors, in the preachers of the more enthusiastic portion of the church, and of all the congregations of dissenters, without, we believe, an exception. Therefore, notwithstanding the

current disclaimers of any wish to precipitate emancipation, we fear the prevalent notions on that head are still as loose as ever. The real contest is between the slave-owners and the *ultra*-abolitionists, and the question must be argued in that view.

The problem, then, is, whether the estates of the planters could, or could not be cultivated as cheaply, and profitably, (or nearly so,) if the slaves were enfranchised, as at present. If they could not, the planters ought in justice, (or, in other words, because it is eminently useful to maintain the rights of property), to receive a compensation in proportion to the loss. But as it is probable that the change in the mode of employing labour would effect not only its diminution, but its entire cessation, the compensation ought to extend to the whole value of the estates. This recompence the country neither would nor could pay to any sufficient extent; the project, therefore, for precipitate emancipation, ought to be abandoned, and we must confine ourselves to such measures as will not deprive the planters of workmen. In the event of a precipitate emancipation, the ultimate cessation of labour we have described may be anticipated with certainty, from the extreme fruitfulness of the soil in the particular commodities consumed by the West-India Negroes, and the consequent absence of sufficient motives for voluntary exertion, *i. e.* the exertion necessary for the planter's purposes. In our last volume, we adduced positive evidence of these facts, and also showed the insufficiency of the proofs on which the *ultra*-abolitionists rely, to establish an opposite conclusion. A report has since appeared from the two Commissioners, deputed to inquire respecting the industry of certain free Negroes, captured in slave-vessels, and established in Tortola, and the rest of the Virgin Isles, by the Government. The portion of this document, which is the work of the Commissioner (Major Moody) who made the fullest inquiries, amply confirms our conclusions; we must add, however, that the other Commissioner materially differed from his colleague, and as we are deprived, by his death, of whatever facts he might have been able to allege in reply to Major Moody's report, we shall abstain from citing that report as authoritative evidence. It is scarcely necessary to go into much more argument of the same kind at present. Perhaps, it is scarcely fair: perhaps it is but just to

\* *Ante*, p. 99.

wait for the result of whatever further researches the abolitionists may think right to institute, in this view, and more particularly, researches into the state of Hayti. Their abstinence from such researches hitherto, is a circumstance inexplicable to us, and not explained by themselves. A company has been established for the cultivation of tropical produce by free labour, "The Tropical Free-Labour Company," and another for working the mines in Hayti, by the leading members of the abolition party: it is clear, therefore, that there is nothing to prevent the inquiries; and there is no probability of their being resisted. Why, therefore, are these researches wanting? Why have none of the numerous missionaries in the West Indies sent home the statistics of that island? It has been publicly stated that a *forced loan* has been resorted to by the Haytian Government to raise the *first instalment* of the money undertaken to be paid to France, as the price of a recognition of independence. This is but a sorry comment on the boast which was founded on the amount and easy subscription to the Haytian loan. The abolitionists must institute this inquiry. The example of Hayti is of the most favourable sort for their purposes. The soil is rich, and well adapted to culture. It was in tillage when the revolted inhabitants took possession. Much useful capital, tools, beasts of burden, fencing, and the like, must have escaped the ravages of the insurrection. The population has since doubled\*; whence we infer an increase in the voluntary motives to exertion, and nearly twenty years have been passed in uninterrupted tranquillity. If steady voluntary labour be not to be found in Hayti, it will be found no where among Negroes. In expectation of the result of these researches, we will add only one further argument against precipitate emancipation. If it be true that the enfranchised Negroes would perform the necessary work, why is there no instance of the present free Negroes having done it? Or if such free labour would be cheaper, as it is contended to be, why do not the planters employ the free Negroes on their estates? It will not suffice to reply that the prejudices of the planters prevent them from employing these Negroes, because they do employ them in the lighter sorts of labour, as carpenters,

joiners, and the like, and even as menial servants, in which capacity, we should infer from their frequent personal communication, they would excite these prejudices more strongly than in the employments of the field. In Russia, which has been so confidently appealed to for proof of the superior advantages of free labour\*, we find competition—we find that the free peasants perform work—we find them employed. The economist, Storch, whose authority is cited on this point, observes, that

"Those who hire slaves in Russia, are obliged to pay more than they who hire free men, unless they live in a place where the competition of free labourers reduces to a level the hire of slaves, and the wages of free labourers. The interior of Russia, and the capital of that empire, furnish proofs of the truth of this observation. In the capital, the competition of free labourers is the greatest, and although the wages of free labour are very high there, the hire of slaves is, notwithstanding, less than in the interior."

This competition of free labour is the vital distinction between the cases of Russia and the West Indies, and renders any conclusion drawn from the one, inapplicable to the other. Mr. Hodgson maintains that the free Negroes will not labour, because "labour is rendered degrading, or at least disreputable, by being confined principally to slaves†." In Russia, labour does not degrade the free peasant, as we see by the above citation; but, supposing that there is a difference in that respect between Russia and the West Indies, Mr. Hodgson's admission that the free Negroes will not labour, proves too much. If they will not labour, that is to say, labour in the degree required by the planters, how do they exist? We answer, that they exist on the produce of a very small quantity of labour, which proves the fact at the bottom of the question, that is, that the Negroes, if free, could exist on a quantity of labour altogether inadequate to the necessities of the planters. Mr. Hodgson argues, that the operation of the principle of population would compel the free Negroes to work‡. The truth of his conclusion is indisputable. But when? At the end of what period? The want of hands for a single year, would ruin every planter in the Colonies.

An objection has been taken to this

\* Parl. Review, Sess. 1825, p. 647.

† *Ibid.* p. 26.

‡ *Ibid.*

mode of conducting the inquiry; but "economists and calculators" (nicknames invented by Mr. Burke—and his be the glory therefore,) are not to be beaten down by the empty declamations of the ultra-abolition party. It must, however, be observed, that empty declamation is not confined to the ultra-abolitionists. The planters themselves are not a whit less sentimental than their opponents. They have chosen, for reasons we shall advert to hereafter, to confound the projects of the latter with the plans of the Government, and have accused the administration of imprudence, hypocrisy, and fanaticism, with as much intemperance as they inculcate the abolitionists themselves. The folly of this conduct is now manifest; it has given rise to feelings of dislike in dispassionate men, and we believe has lost them the countenance of nearly the whole country. The Government plans are faulty in some respects; but to confound them with the projects of the abolitionists, of which many are ill considered in the extreme, is not the way to remedy their defects.

That part of the Government regulation which has roused the greatest opposition on their parts, is the power given to the slave to purchase his freedom, *without the consent of his owner*. Their objections are nearly all contained in the following note, appended to the draft of the new slave-regulations established by the Court of Policy in Demerara.

"The Court, in its anxiety to conform, as much as possible, to the provisions of the Trinidad order, has, after the maturest consideration, found itself called upon by its duty, to confine its deliberations to the object of simplifying the mode of manumission, and rendering it as little expensive as possible, and particularly of securing to the slave thus manumitted his freedom in the most formal and unquestionable manner. It has felt it to be beyond its power, without the breach of a sacred trust, which binds its members to protect the rights and interests of their fellow-colonists, by whom they are nominated for that purpose, to give their sanction to any measure which could, even by construction, imply an acknowledged right on the part of the slave, to demand his freedom, *invito domino*. They feel themselves called upon openly to avow the principle, that they have not the right to invade the property of their fellow-colonists, by admitting that they can in any manner be deprived of it contrary to the law, by which it is secured to them, and which his Majesty has been graciously pleased to guarantee by the articles of capitulation, on which this Colony surrendered to his Majesty's arms. This principle is laid down in Earl Bathurst's letter of

the 9th July, 1823, addressed to the Governors of Colonies, having local legislatures, wherein the *consent of the master* is distinctly coupled with the application to be made, by or on behalf of a slave for freedom, and the Court has the more firmly adhered to the same principle, since the confirmation of it by Earl Bathurst in his despatch of 18th March, 1824, to Sir B. D'Urban, wherein his lordship states that, as the Trinidad Order in Council has been framed according to the circumstances of the Spanish law, so his lordship desires the transmission of the draft of an Order in Council, applying the same provisions to the circumstances of the Dutch law in the colony of Demerara. The difference between the Spanish law in Trinidad and the Dutch law in Demerara, respecting slave property, is great. The Trinidad Order in Council has not affected the principle of the Spanish law, which allows a slave to enfranchise himself by purchase. The Dutch law in this colony gives no such right whatever to a slave: here the interest of an owner in his slave is that of fee-simple absolute; he purchased upon that tenure, he has continued to hold upon the same, and cannot be deprived of that legal title, without a direct violation of property; the law alone can deprive him of it, in consequence of some judicial process, by which he is compelled to surrender it, in satisfaction of some debt. In Trinidad it is otherwise: a person purchasing a slave in that colony knows beforehand that he acquires only a precarious title in such a slave, which depends on the ability of the slave to purchase himself. But let the Spanish law be what it may, it can never alter the existing law of this colony; and it may fairly be inferred from Lord Bathurst's letter, that no subversion of the law is intended, and that it is far from the intention of his Majesty's government to annihilate in this colony the right of property, which is scrupulously held sacred throughout his Majesty's dominions. Slaves in this colony are chattels as much as any other moveable property, unless attached to a mortgaged property, and included in the mortgage, when, during the existence of such mortgage, they are considered as part of the whole property. In the latter case, the owner of such mortgaged estate cannot dismember his property piecemeal, but without such mortgage he has the entire control over his slaves. Neither is it the law that proprietors can be forced to dispose of their property, real or personal, when its value is offered to them by others. To give to the slave the right of purchasing himself, against the will and consent of his owner, will annihilate the right of the owner, and confer on the slave a power which no other person possesses."

Let us here stop to examine this reasoning. With respect to the first argument, the absence of a *right* to make a regulation affecting property in the way proposed, there is a fallacy in the term itself. A *right* is a capability of acting or enjoying, under protection against all who might prevent such action or enjoyment by superior force. A legislature has no rights. It has power. It has that superior force by which it guarantees the rights of others;

by which also it sets those rights aside, when expediency requires their abolition. Then what would resist the power of the court of policy? Not the planters, for those who should not assent (as most would assent, to the decision of their representatives), would be quelled by the first report of a regimental musket; nor the slaves for they would support the regulation. The distinction between the property in the slaves in Trinidad, and the slaves in Demerara, and it may be added the slaves in all the other colonies, is no reason, considered abstractedly, as urged by the court of policy. If the property in the Demerara slaves be more absolute than in the slaves of Trinidad, it is of greater value; and if the compensation for the manumission be fixed at a higher proportionate rate, the ends of justice are obtained. As to destroying the right of property, it may be observed, that there is no advantage, *per se*, in the right of property; its advantage consists in its results. The results in the West Indies, as every where else, are money or money's worth; and these the right of self-enfranchisement does not take away. The comparison between the obligation of selling freedom to the slaves, and selling their estates, is faulty, because the circumstances are not the same. The end of a law or obligation is to do good. A law to oblige the sale of an estate against the will of the owner, would do no good to any body; the right of self-enfranchisement does good to the slaves, or at least, has that object in view. These fallacies, like all others connected with affairs of government, arise either from confounding the end of law with the means, or keeping the end out of sight altogether, and they are easily detected by applying the end as a test. The objection drawn from Lord Bathurst's demanding a draft of a regulation from Demerara, applicable "to the provisions of the Dutch law," which gives an absolute property in slaves, is mere chicane. The single and manifest intention of the published proceedings of the legislature, and also of the Government, was that the right of self-enfranchisement should every where be granted in an available manner. If the obtaining the consent of the master be an obstacle to the manumission, which the objection must suppose, (for it would otherwise be insignificant,) the intentions of the legislature and Government would be thwarted. But

this is not all. The fact itself is misrepresented. Lord Bathurst states, that obstacles to manumission may arise from the slave and his children being made the subjects of entails, family settlement, mortgage, and the like, "and his manumission cannot be effected without the concurrence of a series of reversioners, remainder-men, mortgagees or mortgagers, some of whom may be infants, and others may not even be in existence during the life of the slave." This concurrence is explained in the clause providing the remedy. It is stated, that permanent Commissioners should be appointed to summon the parties to "attend at the time and place of the appraisal of the slave," and if they did not attend, the appraisal should be made in their absence. In another letter from Lord Bathurst to the Governor of Demerara and Berbice, under the *same date*, and inclosing the letter referred to by the Court of Policy, his lordship directs the governors to press the adoption of his suggestion by the Court of Policy, "applying them to the Colony of Demerara, in such manner as is most suited to the existing laws and usages of that colony, preserving at the same time their entire spirit."

The note goes on to state as follows:—

"The ruinous effect of such a state of things could hardly be calculated in their full extent. All tradesmen, such as carpenters, masons, coopers, &c., having one or a few slaves whom they have brought up to their trade, and with whom they earn their living, would be exposed to lose their slaves, the more valuable to them, in proportion to the smallness of their number. Unprincipled persons might tamper with slaves, furnish them, on certain conditions, with money, and entice them in this way from the service of their owner, with a view to employ them under an indenture, and in their new condition probably ill-treat them; while the owner, who is deprived of them, sustains a loss which no money can repair: his trade is at a stand, or at least on the decline; he is obliged, from want of employment sufficient to maintain his family, to spend for their support the money he has received for the slaves thus forced from him; and, finally, he becomes a beggar, surrounded by a miserable family, without means to relieve them.

"The fate of the planters would be equally distressing. It is fairly calculated that the average number of able effective people upon an estate is about one-third of the whole gang, the remaining two-thirds being composed of infants, who are a burden to the owner, and of the aged, who receive from him support. The parties most able to obtain their freedom are among the former, a class without whose assistance the proprietor would be unable to carry

on the cultivation and management of his property. If the power to purchase freedom be absolutely vested in the slave, free from all control on the part of the owner, the latter would hold the same by a precarious tenure, defeasible on the production of a sum of money, either by the slave, or any other on his behalf. Besides, tradesmen of every description, and others, who form the most useful and indispensable class, might thus be removed from the estate, to the irremediable detriment of the property, and consequent ruin of the owner, as the non-importation of slaves renders the replacing of such slaves so manumitted a matter of impossibility. In progress of a short time, a most valuable estate might thus be rendered useless, for the want of able men, cultivators, as well as tradesmen."

The Trinidad Order provides that if the master and slave cannot agree upon the terms, one appraiser shall be appointed on each side, and an umpire by the chief-judge, to value the slave, and, on the payment of the appraised value into the treasury, the slave shall be free. Value here means value to the master. The real value of a slave must depend upon the facility or difficulty of substituting free-labour for the labour of such slave, and if the price be determined on that principle, it must be a full compensation. In ordinary cases, the value may be ascertained by reference to the market; in extraordinary ones, that is to say, when there is no other slave to be had of the same sort, or when no free-black can be found to do the same work, the compensation must be equal to the whole loss of the owner, including the price of the slave, and loss in other respects, as of his lands or tools becoming useless in consequence of the slave's withdrawing. The price of the first order of slaves might be governed by a *maximum*, as we have before suggested, in order to prevent any combination between the master and the slave's agent. A *maximum* cannot be established in the case of the latter, which resembles the cases of houses, buildings, &c., required to be pulled down for the purpose of building bridges, or making streets. The value of these slaves to their owners is determined by their particular advantages, and the difficulty of finding the same things with the same advantages elsewhere; in stricter terms, it is determined by their particular services. Thus, if a Demerara carpenter can get a second slave equally good to supply the place of one emancipated, the price of the latter cannot form the subject of doubt; if he cannot get another, nor a free journeyman, the whole

loss of the carpenter in the uselessness of his tools, and the diminution of his trade, must form part of it. It appears that, in effect, the Court of Policy misunderstood the order; they think that a regulated scale of *maxima* is to be established, which is quite inconsistent with the scope of that regulation in respect of compensation.

It must not, however, be forgotten that this principle of compensation is attended by an important disadvantage. The smaller the value of the slave, the less will be the difficulty of finding the means of buying his freedom; and, by consequence, the stronger his desire to do the latter, the greater will be his inducement to reduce himself to little value, or at least to prevent himself from rising to a great one. Soldiers maim themselves to get their discharge; slaves will become awkward and lazy to get theirs; and the consequences, in part, will be loss to the master, increased severity towards the slave, and greater unfitness for freedom, should the slave obtain it.

An observation fell from Mr. R. Ellis, which calls for some attention. "If the slave could purchase his freedom by right or law, it would naturally be the object of his master to keep him poor, by depriving him of those indulgences and privileges, which under other circumstances, would be allowed him\*." This objection would hold good if the "indulgences and privileges" were merely boons conferred by the master. An attempt has been made, in the Trinidad order, to insure to the slave a holiday of one day in the week, that he may have the opportunity of earning money from his provision-ground, or by work. This property in the money so earned, is secured by other provisions in the same regulation. The provision-ground can at any time be re-absorbed by the planter into his plantation, whereby that resource can be cut off; and, as it is an operation which must readily suggest itself, and is accompanied by no difficulty, it seems but too probable that it will be generally carried into effect. A further difficulty occurs with respect to the holiday-work. Combinations of masters against labourers, are, in general, far from frequent; but a state of things distinct from the ordinary one, may call such a combination into existence. For such a combination in the West Indies against employing the slaves

\* *Ants.* p. 127.

on holidays, both the facilities and incentives are peculiar. In European countries, the only motive to combination is the pecuniary interest. In the colonies there is a standing and well-understood conspiracy of the whites against the blacks—the conspiracy of the powerful few—persons in the exclusive possession of wealth, of a peculiar colour, language and manners, and uniformly exasperated by fear and hatred—against a race, inferior in every particular but numbers. The pecuniary motive will depend upon their opinion of the balance of advantages for themselves between losing labour during the holidays, and the eventual emancipation. What, then, is the proper remedy for the withholding the “indulgences and privileges” from the slaves? Such a remedy remains to be devised, and seems to be of difficult contrivance. If the masters were obliged to employ the holiday-work of the slaves, the slaves would take the wages without doing the work; and if the slaves were obliged to work, they would have none of the benefits of the holiday, but the wages. The masters may, and, if the thing can be done effectually, ought to be compelled to assign provision-grounds. But how far such an enactment might be frustrated by assigning bad soils, or inconvenient situations, or how far the already low price of the particular commodities which the leisure and means of the slave permit him to raise, might be reduced to worthlessness by the immense increase which the inducement of self-enfranchisement would produce, we cannot undertake to decide.

The next provision in the Trinidad order resisted by the planters, is that which establishes the admissibility of slave evidence. This provision is opposed with fallacies mainly borrowed from lawyers. One of them is, that slaves would make the tribunals the instruments of doing mischief to their masters. If they swear the truth, their evidence may do mischief to their masters; but the result to the community will be justice. They must, therefore, swear what is false. But no mischief will follow such swearing, unless their evidence is believed; and as the argument supposes that their evidence is known, or suspected, to be false, in other words, that it will not be believed, no mischief can possibly occur.—A second objection is, that the slaves cannot be made to understand the nature and sanction of

oaths. Although it may be true that a slave cannot be made to understand that amongst the penalties of uttering falsehood, there are pains in a *future* life; it does not follow that he may not be made to understand, for he certainly may be made to *feel*, that amongst these penalties there are sufficient pains in *this* life. Before trying the efficacy of *temporal* punishment for the purpose of securing veracity, why reject his evidence because he cannot (if he cannot) be enlightened with respect to *eternal* punishment? Doubts might be suggested as to the efficacy of oaths; it might even be explained that they tend rather to increase, than to prevent false evidence; that, by confining punishment to perjury, mendacity, or the habit which leads to perjury, is encouraged; that in ninety-nine cases in the hundred, the supreme sanction is not so much as adverted to by the witness; that the fear of the worldly consequences of perjury is all in all:—but such a subject is too extensive and important for cursory discussion.

The planters object to the restrictions on the employment of the whip; to the limitation of the number of stripes in the case of men, and its total interdiction in the case of women. If the limited number of stripes will not act as a sufficient stimulus, the driver will resort to inflictions out of the reach of the law, which, as they must be concealed, will probably be more cruel. To European minds, chastisement of women is doubtless a revolting idea. But the women slave must work; and the planter must be armed with the means of making them work. If they be imprisoned, he loses their labour, and their indolence will be gratified. If they be compelled to work in prison, he equally loses their labour, and they suffer from the hands of the gaoler that which they would have suffered from their master. If the punishment employed by the gaoler be not of the sort employed by the master—if it be not the whip—the fact will prove what we have already advanced, viz. that there are inflictions not specified in the law; and the master will resort to them for the punishment of his men slaves, in order to make up for the insufficiency of the legal punishment, and also in order to repossess himself of his old power of punishing the women. If the plans of Government be followed to the letter, the masters, in all probability, will eventually

lose their control over the women, and a great part of it over the men. The consequent loss in labour will be a serious loss; but still more serious will be the diminution of that feeling of submission which is the chief guarantee against insurrection. The evil is indisputably a great one; but it is idle to blame the masters, without furnishing them with a substitute for punishment.

Although there is a broad distinction between the plans of the Government and those of the abolitionists, the West Indians either will not or cannot observe it: they persist in confounding them; and, perhaps, the causes of this confusion may be traced (in some degree) in the proceedings of parliament. The abolitionists began the discussion, and have ever since kept the advanced ground in complaining, and proposing measures, and the Government, in the steps it has adopted, and even in the language which individual ministers have held, has as uniformly appeared to *yield* to their suggestions, and to follow their driving. When the question was introduced in the House of Commons, in 1823, on the strength of petitions remarkable for their intemperance both in language and project, the ministers, without taking breath, proposed only an alteration in the proposition, which to this day, sounds in most ears like an insignificant verbal change. If they had rejected the proposition altogether, and condemned the violence with which it was brought forward, they might have found an after opportunity for producing their own plan independently; by which they would at least have conciliated the more reasonable of the planters. In addition to this, the planters are well aware that the management of the colonies on the African coast (the establishment of which they regard as a standing censure on themselves), is committed by the Government to the most intemperate of the abolitionists. This, then, is the actual situation and state of mind of the West India planter. Confounding the two parties together,—believing the ministerial plans a mere cloak for ulterior measures intended to deprive him of his property—surrounded by a hostile population, in the proportion of nearly twenty to one—placed within a few days sail of a colony where a formidable rebellion was lately quelled with much loss, and nearly within sight of an island, on which, thirty years ago, half the whites were killed by the Negroes,

who have succeeded in preventing the restoration of their property, with the exception of a trifling indemnity of a tenth, or a twelfth promised thirty years afterwards—placed in this situation, entertaining, groundlessly or not, apprehensions like these, he talks of resisting the authority from which the source of his apprehension emanates. But to what does this resistance amount? Mr. Brougham said last session, that the promises of the colonists “had ended in nothing\*.” The assertion is not exactly true, although much of Mr. Brougham’s statement is undeniable. That statement itself, however, proves that the resistance of the colonists is rather the effect of (be it hoped) a momentary passion, than of deliberate intention. Four of the islands, (Tobago, Grenada, St. Vincent’s and Dominica) according to the parliamentary papers, have given a species of protection to the property of slaves. Two (Tobago and Grenada) have diminished the quantity of punishment to be inflicted by the master. One (the Bahamas) has totally prevented the separation of families by private or judicial sale; and one (Grenada) by judicial sale only; in which the former goes further, and the latter as far as the Trinidad Order. Tobago, Grenada, and St. Vincent’s have gone further than the latter regulation on the subject of slave evidence, by the express reception of slave evidence against whites in capital cases. This is one of the topics which has excited the warmest opposition in Jamaica, and many of the other islands: the discrepancy proves that there is no combination or concert between the colonies. Some weight will also be attributed to the effect of the imperfect success, (if we may trust the Jamaica Assembly,) which has attended the Government experiments. For these experiments, Trinidad and Demerara were selected; of which, the former has at present been only eighteen months in trial, the latter hardly one year. Mr. W. Horton (in February last) describes the success of the experiments†. But at a later period, the Jamaica House of Assembly deny the facts; for in an address to the Duke of Manchester, in October last, they state that they had received accounts of the operation of the experiment in Trinidad, from the date of the order in council, which disagreed with Mr. Horton’s representation‡.

‡ Kingston Chronicle, Oct. 19.

But suppose the resistance of the colonies to have arrived at the point which Mr. Canning styles "confirmed contumacy," and that the time is come for the application of the means recommended by Mr. W. Smith—"fear or force\*." According to Mr. Canning there are two methods of applying "fear or force"—the one by fiscal, the other, by military operations. Fiscal vexations are of various kinds. The ports or harbours might be removed from such towns as should exhibit marked opposition, as in the case of the Boston Port bill, before the American war; but as such a measure would be plainly inapplicable to the small islands, and to such of the large ones as have not a second port, we conceive that it could not be executed with any general effect.—The Government at home might lower the duties on East India sugar, or impose a high duty on West India exports or imports. If the reader will refer to our last year's volume on the subject of East India sugar, he will find that the mischief apprehended by the West Indians from diminishing the duty on that article, is altogether unfounded†; West India sugar being able to compete in the foreign market with that of the East Indies, with the trifling aid of a bounty of 3s. per cwt. on its transit through this country. But even on the supposition that the lowering of the duties would be mischievous to the West Indians, it would be undeserved by such of the colonies as would submit, (as all the smaller ones must do immediately,) in the event of an ultimate resort to force. The imposition of a high duty on the export of West India produce, would only be mischievous to the planters in proportion as it would lessen the quantity sold; but exactly as that effect should ensue, the consumers at home would be mulcted by a rise in price on West India commodities; to which must be added the decrease in the production of those commodities, cottons, provisions, and the like, for which the West India produce is exchanged. The infliction would fall as heavily upon the mother country as upon the colonies.—The effect of a duty on articles imported into the West Indies, would depend on its amount. If it were not heavy, the consumption might go on as at present; but if too heavy, it would be lessened exactly in proportion to the heaviness; if it

amounted to a prohibition, it would, of course, cease altogether. The moment a decrease of consumption should begin, a diminution in West India produce would commence. The infliction on the West Indians would be much the same as in the case of imposing a duty on West India exports. The planters would go without our commodities, and give us less sugar and coffee; and this country would produce less cottons and provisions, and pay dearer for sugar and coffee, or go without them. The planters might follow the foolish example of other countries, and revenge themselves by an independent duty of their own; in that case, both parties would be worse off than before. Before the home Government ventures to vex the planters with duties, it must ascertain with what portion of good-will the mother country will lay the rod on its own back. The abolitionists have had for a little while anti-saccharine and anti-sugar societies; but as they did not succeed any more than the anti-beef and mutton associations, projected by the late Mr. Ritson against graziers and butchers, we should infer that the main body of sugar consumers would be altogether recusant. Neither would the decrease in the revenue be a consideration entirely to be rejected.

Lastly comes the resort to military force. If the Government withdrew its troops, the slaves would put an end to the subject, after the example of the Haytians. The military force, therefore, must remain at all events. But as the troops already in the colonies are now barely sufficient to intimidate the slaves, an additional force must be sent over to intimidate their masters. The success of such a step in the smaller islands, in every respect, may be looked upon as certain. But it would be a hazardous assertion to say that the effect on the tranquillity of the slaves in the larger colonies, would not be serious in the highest degree. If it ended in actual conflict, their rising must be looked upon as inevitable. And such are the extraordinary facilities for negro operations, presented in the interior both of Jamaica and Demerara\*—such, too, is the fatal effect of the climate upon European soldiers, especially whilst in campaign, that no man can say when, or at what cost of life and

\* *Ante*, p. 60.

† P. 633.

\* See the accounts of the two Maroon wars in Jamaica, contained in Bryan Edwards work, and Captain Stedman's Expedition to Surinam.

money, such a rising would be quelled, or whether it could be quelled at all. By some, this part of the subject\* has been treated lightly, nor do we question that the terrors of the planters are greatly exaggerated; but we cannot help calling to mind, that within ten years we have witnessed two formidable insurrections, connected in some sort with the plans of the *ultra*-abolitionists, and quelled only at the expence of many lives, and that the late slave trials in Jamaica exhibit, beyond question, considerable indications, that something serious was in preparation amongst the negroes in that island.

But let not the reader infer from the difficulties in the way of *coercing* the colonists, that no improvement can or will take place in the condition of the slaves. Something, we have seen, though little, has been done; and when the planters shall grow cool enough to note the distinction between the Government plans and those of the violent abolitionists,—when, moreover, they shall witness the successful issue of the former, we may hope for more extensive amendments. The good opinion of the mother country is of importance with all colonies; with such as are so dependent, and so small in point of white society as the West Indies, it is of the very first importance. The planters and other parties, connected with the colonies, who reside in this country, and commonly called the West India interest, have accorded their approbation to the Government plans. Before resorting to measures of coercion, it is the part of wise men at least to await the effect of these circumstances upon the resident West India planters.

There is, however, a species of interference, ministerial at least, if not legislative, which the Government might resort to without infringing upon the independence claimed by the colonists. No governor, or other public officer of the colonies, ought to possess slave property in any part of the world whatever. The influence of the white society by which he is surrounded, would give him a sufficient bias against the slaves, without the addition of any personal interest. In the majority of the islands, he has the power to appoint the magistrates, of whom the slave-courts are composed. Of the feebleness and indecision of one governor, the Duke of Manchester, and

the odious injustice of those courts, the trials of the rebel slaves in Jamaica, give sufficient evidence\*. The liability of the colonies to aggression in times of war, may be a good reason for selecting the governors from the military class, but no blame is too severe for those who make the choice in the manner in which it is ordinarily made. A few of these officers, (the late governor of Barbadoes is an instance,) are appointed on account of peculiar merit in their profession; but we hardly remember an instance of any appointment on account of particular fitness for the office. The same complaint attaches to the appointment of the colonial judges. They are notoriously selected from the poor and unsuccessful adventurers at the English bar. They are altogether at the mercy of the colonists, for they receive their salaries from the assemblies. By suffering such persons to expose themselves to an additional source of perversion in the possession of slave-property, we take nearly every precaution for the attainment of injustice. The force of this argument was acknowledged by the Government; but it was contended that the prohibition ought not to extend to the inferior judicial officers, because it “would render the property in slaves a degradation; contrary to the resolutions unanimously assented to in 1823, which recognised that species of property, and promised it protection†.” Now, since it is admitted that the prohibition ought to extend to the leading judges, we should infer that the amount of “degradation” was so great, that it would not be worth while to take the inferior ones into the account on such a ground. Arguing, however, upon the general principle, that the prohibition is a degradation, it might be questioned whether to do justice to the slaves is not more important than to hurt the feelings of the planters; and whether it is not a greater “degradation” to the colonists to have unjust judges, than to be disqualified from acting in the judicial capacity. But the argument is altogether unsound. No man is “degraded” by a prohibition to do injustice, or to expose himself to the doing of it. If the proposition went to disqualify the colonists from being judges everywhere, in Great Britain as well as in the West Indies, there would be some truth in the objection.

\* *E.g.* Mr. Brougham, *ante*, p. 124.

\* *Ante*, p. 112.

† *Ante*, p. 83, et seq.

How the prohibition could effect slave-property, or its protection, we are entirely at a loss to understand. If the West Indians claim the exercise of injustice towards their slaves, in order to protect their property, they must not be listened to; and if Mr. Horton suppose that slave-property would sell for less in the market, by reason of the prohibition, he may depend upon being altogether in the wrong.

II. The only countries of which the laws do not forbid the traffic in slaves, are Portugal and Brazil, and with them it is confined to the coasts of Africa, south of the line. The United States, the Netherlands, Spain, France, and the new states of South America, are bound by treaty with this country to prohibit it, and have all established laws to prevent their subjects from engaging in it. How far these laws are efficient, or their execution enforced, we may judge from a few facts in the papers relative to this subject, which were laid before parliament last year.

In all the British slave colonies there are laws enforcing, under penalties, the registration of the slaves of every estate, in every house, and in every gang, in short, throughout every settlement; and by a late act of parliament, trading in slaves, even a single act of buying a slave as a dealer, is punishable with death. With the single exception of Demerara, the colonies into which their importation is prohibited, are overstocked with slaves, mostly Creoles; and cultivation, as it is alleged, has been so overdone there, as to have reduced the profits of stock to a *minimum*. If we may take these facts as criteria, whereby to estimate the strength of the motives for importing slaves into these colonies, we may also take them for the same purpose with respect to the motives of foreign slave-dealers who carry their slaves to other settlements, where, with the exception of Martinique, Guadaloupe, and Cuba, there is nearly a boundless quantity of land remaining to be cultivated.

In the United States, the temptation to import slaves from Africa is done away, by the unfortunate commerce which has sprung up between Maryland and Virginia, and the rest of the Slave states, by which the latter are amply supplied with slaves, who are bred in the former. There are, however, traces of the employment of American ships, in the foreign slave trade.

Sess. 1826.

The British Consul at Bahia, observes, that three American vessels, the *Fenelon*, *William*, and *La Fayette*, were lately chartered from Bahia to the coast of Africa\*. Mr. Zea Bermudez, the Spanish minister, has asserted that British capital is also employed in the Cuba traffic; but his assertion is peremptorily denied by Mr. Kilbee, the commissary judge of the mixed commission at Havannah†. However, on the 29th September, 1825, Commodore Bullen captured the brig *Z*, under Dutch colours, with a valuable cargo, fitted up for the slave trade, and bound from the West Indies to the African coast: by the list of shipment the cargo belonged to British subjects, resident at St. Thomas's‡.

With respect to the Netherlands, in addition to the *Z*, under Dutch colours, the *Bey*, and the *Venus*, two other vessels under the same flag, have been condemned at Sierra Leone within the last year.

The parliamentary documents shew that there were last year forty-nine Spanish vessels engaged in the traffic, and that in 1824, 16,000 slaves were put ashore at the Havannah, by forty-four traders, partly Spanish, and partly French, and that, in the first month of 1825, twenty traders, fifteen Spanish, and five French, arrived at Cuba with 5766 slaves: the trade continued during the whole year, and in December eight traders landed 2300 slaves§. Fifty-five French vessels appear from the same authority to be engaged in the trade||.

In 1824, 3137 slaves were imported into Bahia; 1571 during the first six months of 1825; and 25,769 were imported into Rio Janeiro during the whole of the latter year. The list of the importations into Maranhão, the other great mart, is wanting¶. By the account of Mr. Vice-Consul Follett, at Bahia, it appears, "that the *majority* of the slaves "are systematically brought from those "parts prohibited by treaty" (the north of the line)\*\*.

The new American States have some of them abolished, not only the trade, but

slavery itself. Guatemala was the last in taking the latter step\*, and it is proper to state, in order to prevent wrong inferences from being drawn, with respect to sudden emancipation, that the whole number of slaves in that state was only 500. We might load our pages with accounts of the horrible cruelties committed in this odious traffic, from a desire of taking in great cargoes, and from the precautions necessarily resorted to against the British, American, and French cruisers. We might also shew what manœuvres—what variety of flags, false papers, logs and charters, the traders make use of to deceive the officers who search them. But the same sort of accounts have been so repeatedly before the public, that nothing new would be conveyed to the reader by extracting the atrocious stories contained in the papers of last year.

We firmly believe that nothing effectual can be done towards suppressing the trade, until it is universally declared piracy, and the English vessels allowed to carry the traders to some of the African settlements, St. Helena, or the West Indies, to be tried and hanged. It appears distinctly from the parliamentary papers, that the Governments of Spain, France, Portugal, and Brazil, make no efforts whatever to enforce the laws for putting down the traffic, and that the authorities in Cuba and Brazil not only neglect to execute the laws, but in some cases, the individuals are engaged in it themselves. Treaties and laws where such parties and such interests are concerned, are mere waste paper. Whatever may be the established regulations, none will be effectual until their execution be confided to better hands.

The Committee on the Mauritius Slave-trade, report, that they have only found it practicable to commence their investigation†. They have laid considerable bodies of evidence before the House already, but we must wait for the close of the inquiry before we enter upon the subject.

III. Mr. Hume observed with reference to the settlement at Sierra Leone, that "the best thing to do with it, would be to get rid of it as fast as possible ‡."

\* Twentieth Report of African Institution, App. G. p. 172.

† Slave Trade Papers, 1826. No. 430

‡ *Ante*, p. 130.

Mr. Hume looks mainly at the expense; but other points remain to be considered, before his suggestion can be assented to.

The settlement was projected in 1787, by some of those who first proposed the abolition of the slave trade; but owing to the want of proper care in selecting the settlers, the establishment suffered so severely from insubordination, the hostility of the neighbouring tribes of Negroes, and the mortality which forms so unvarying a feature of the place, that it was nearly destroyed. In 1791, a company of private adventurers and abolitionists, including many persons of note, attempted to re-establish the settlement: from that time it took firmer root, and attracted considerable attention. The capital of the company was 250,000*l.* in addition to which, 100,000*l.* were afterwards raised, and large sums were annually granted by the Government for the maintenance of the civil and military establishments. But the company shared the fate of most other joint-stock undertakings; its objects were ill calculated, or its means mismanaged—in short, in the year 1807, it was brought to the verge of ruin. In 1807, this country abolished the slave trade. The promoters of that measure could not throw the slaves to be captured in the middle passage into the sea, nor send them back to the district whence they came, to be re-shipped in the next slave vessel—they had projects, we fear, not very materially weighed, for extending civilization, and they were in power at a time when the expenditure of the public monies was never scrutinized. They did not hesitate to accept an offer from the company of the Sierra Leone settlement. From that time the settlement has remained an English colony, and has been sustained at a great expense to the British public.

The chief object of the projectors of this settlement was the destruction of the slave trade; which, it was believed, would decline under the influence and example of the colony. The other objects were the introduction of Christianity and the arts of Europe into Africa, the encouragement of cultivation by free labour, and the establishment of a school for teaching letters and the agricultural arts.

We purpose, before deciding on propriety of Mr. Hume's proposal,

\* First Report of African Institution.

see objects in themselves; the which they have been, and are, accomplished; and the loss already incurred. tlement, we believe, is about miles long by twenty broad; er than Middlesex. Its popu- resent, and we are not aware ever much larger, consists of : settlers, a few white troops, alattoes, and about 16,000 consisting of slaves captured aders, maroons from Jamaica, n Nova Scotia, and soldiers from the West India regi- y a colony of this kind, facili- s thought, would be afforded g, exhorting, and influencing ealing nations of the interior, their traffic in slaves. By the g nations are meant the na- dle Africa, consisting of we how many millions, and dwel- of them, at unknown distances. n trade, however, beyond that was entirely confined to the a little timber, gold-dust, and not beads and trinkets: but as either possessed these, nor any le in sufficient quantity for their could have got rid of them if they legitimate commerce was not upplant the slave trade. t also have been doubted, how mple of a few thousand negroes, twenty different tongues, and tly, not likely to carry on very amunications with the interior, er have been followed or un- or even if it could have rstood, how far it would have wed, seeing that the black set- almost entirely supported by nds, and their capital provided ile the nations to be reclaimed ch advantage. With respect to ning objects of the settlement, yment of free black labourers nple to the West India planters, instruction of the surrounding ough has been said already. at are the actual results of the one project? It is a notorious notwithstanding the abolition of trade by England, the Nether- : United States, and all the new America, except Brazil, that ic is carried on to an extent led at any former period.

"On the whole," says the twentieth Report of the African Institution (which strenuously supports the settlement), "it appears that the slave trade *has increased during the last year*; and that, notwithstanding the number of prizes taken, it continues to rage with unabated fury; and that the coast, with the exception of the British settlements and their immediate neighbour- hoods, is in a worse condition than it has been for years past; that the Spaniards and Brazilians carry their profligacy as far as ever; whilst the French have become the slave-car- riers of the Antilles."

It is equally notorious that, owing to the employment of the means adopted for the prevention of the slave trade, (means, to which this colony is subservient,) the sufferings of the slaves in the middle pas- sage are, if possible, even greater now, than they were before the abolition, at the establishment of the colony. The influ- ence of example, therefore, is wholly lost upon the slave-trading tribes.

The next question is, the introduction of the arts of Europe, and the promotion of the agriculture.—First, as to cultivation. It is primarily important to prove that the free negro will bestow for hire the same labour as the planter extorts from the slave; that is to say, that he will cultivate sugar and other West India produce. The ex- ports of this colony consist of the follow- ing articles

African teak timber.  
Camwood.  
Palm oil.  
Elephants' teeth and scrivelloes.  
Gold dust.  
Rice.  
Bees' wax.  
Gum copal.  
African fruit.  
Arrow root.  
Guinea pepper.  
Shingles.  
Mats.  
Guinea corn.  
Malagetta pepper.

Of these articles only *one* is produced in the West Indies; and that in limited quantities. In 1826, the following articles of West India produce were imported into the colony, viz.:—

|               |         |      |      |
|---------------|---------|------|------|
|               | ewts.   | qrs. | lbs. |
| Sugar . . . . | 3013    | 2    | 13   |
|               | galls.  |      |      |
| Rum . . . .   | 130,000 |      |      |

But the produce of the settlement is not only altogether different from that of the West Indies, and, by consequence,

affords little analogy with respect to slave labour *there*; it is, moreover, chiefly of such a kind as to require hardly any labour whatever. It appears that even this little labour is not performed by the settlers.

"From the fertile and well-cultivated district of Formare, the indolent inhabitants of Sierra Leone," says Major Laing, "are principally supplied with *rice and other provisions*; and it is they who undertake the laborious and fatiguing work of cutting, squaring, and floating to the trading stations, the immense bodies of heavy *teak timber*, exported from Sierra Leone, and, in like manner, the natives on the banks of the Upper Kooranko cut and float down that river and the Robelle, the *camwood* exported from Free Town\*."

In the returns made to the House of Commons of the list of exports cited above it, is stated that

"No portion scarcely of these exports is the produce of Sierra Leone, to the exception of the shingles cut in the liberated African villages, unless the *timber* which is grown in the country of the natives, upon the banks of the river, is so considered†."

The late Governor-General Turner, in a despatch dated 25th Jan. 1826, says, that

"Under the arrangements hitherto prevailing, they (the negroes) have been distributed amongst the villages, where they have been for years supported in idleness by the Government; but the villages and the poor land in the mountains where they are situated, already begin to refuse them a scanty subsistence, and they have begun to wander in search of better soil and easier subsistence. The evident tendency of this is, that they will retrograde in the woods into a state of nature and barbarism, or become vagrants about Free Town, and the more populous villages. In cases where they have been located in the villages, and received gratuitous maintenance, they can with difficulty be induced to give a day's labour even for good wages. It would but lead to disappointment to imagine that a large mass of poor ignorant people, without capital, skill, or industry, could be brought to maintain themselves, and to raise articles of export, without the assistance of labour."

Can it be supposed that this colony has made any progress in civilizing any part of Africa? Or can it be fairly set up as an example to the West India planter?

With respect to its religious influence: Looking at the parliamentary papers, we find that there are from two to three

thousand persons receiving education; nearly six thousand persons, "usually," frequenting the chapels and churches, which are twenty-three in number, with twenty-one pastors, of different descriptions. In spite of what has been already said of the industry of the settlers, this account would portend a considerable degree of improvement. Let us see, then, in what view the actual state of religion is regarded by eye-witnesses. Mr. Rabau, a missionary from the Church Missionary Society, states, that

"It must be a matter of lamentation to all who know the value of a place of public worship, that a suitable place has not been prepared for this purpose. At some of the stations a degree of indifference to the public means of grace, which was manifested for a time, could not be observed without pain. The instances of decided piety, which have been brought to light during this period, are comparatively few; those who publicly and solemnly profess themselves the disciples of Christ, are but few compared with the mass of the people. At Kissey town, a considerable portion of them live as without God in the world\*."

From such a state of things we should not be led to expect very warm efforts to spread religion amongst the surrounding tribes. According to Major Laing not a single missionary is to be found beyond the precincts of the colony; and even within the peninsula itself, on which Free-town is built, are several native villages, in a deplorable state of barbarism, which have never heard the voice of a missionary. At Toma, only 45 miles from Free-town, Major Laing was the first white man ever seen, and as he advanced into the Timanee country, which almost borders on the gardens of Free-town, he could not avoid expressing great surprise on observing how little it had gained from its vicinity to Sierra Leone. At Yeba, situated in the western part of the Timanee country, the people appeared to be hardly a remove from the brute creation, and even called forth the pity of Major Laing's (negro) companions†.

Remains the question of expense and loss.—With respect to the expense, we must premise that a vast portion of it is not stated, being so mixed up with general estimates and disbursements, as to be entirely unascertainable. From the following items we may judge of the whole extent.

| Commissariat .....                                       | 49,642 | 15 | 4½ |
| 1826. Army Estimates and Civil Establishment .....       | 63,672 | 0  | 0  |

## PUBLIC BUILDINGS.

|                                                                            |        |    |     |
|----------------------------------------------------------------------------|--------|----|-----|
| Sums drawn by Gov. Macarthy, from 1st Dec. 1821, to 16th April, 1824 ..... | 26,701 | 12 | 11½ |
| Annual Average .....                                                       | 11,459 | 0  | 0   |

This, we must repeat, is only a portion of the expence of this settlement; and to balance it, the Government receives import duties, amounting, in 1823, to 8,730l. 8s.!

Of the horrible mortality amongst the whites, no accurate account is within reach, but we have understood that, in the short space of eighteen months ending June 1826, twenty-five officers, five or six of the medical department, and nearly all the privates, were cut off by the climate, which appears to be the very worst that has yet been experienced on the globe.

Does the future hold out any prospect of a better state of things?—The colony has been tried during nearly forty years; no means have been spared to secure the accomplishment of the objects for which it was formed; the result has been an entire failure in every particular, accompanied with great waste of money, and loss of lives. The late excellent Governor, General Turner, set out with a strong belief that he could change the condition of affairs, and it has been stated that one of the chief causes of his death arose from disappointment. But even if it could be

shewn that there was a probability of future success, nothing but a measure of it, far beyond what the most extravagant expectations can now anticipate, would repay us for such an expenditure.

This subject may be resumed when we receive the Report of the Commissioners at present deputed to inquire into the condition of the colony.

#### FINANCE AND TRADE.

##### *The Budget, &c.*

THE measures brought forward in the last session, relating to Finance, were so limited, and the discussions so meagre, that little more seems necessary, under this head, than to "note the deficiency." We shall detain the reader but for a moment on one or two detached points in the debates.

The principal modification in the revenue, was the reduction of the duty on tobacco. The peculiar evils of this tax, *which are denied by none*, were pointed out in our volume of last year. The extreme disproportion of the duty to the value of the commodity; the severity with which it presses upon the lowest classes of society, to whom tobacco is almost a necessary, while to the higher it is scarcely a luxury; the facilities and encouragement which so high a duty holds out to illicit trading, concur in rendering the duty on this article one of the most objectionable

imposts in the commercial code. The reduction of 25 per cent. which has already taken place, is entirely the work of accident; and it is highly satisfactory to find that this change has been followed by a diminution of only 80,236l. 18s. 7½d\*, in a gross revenue of 3,390,606l. 19s. 8½d. The change, however, such as it is, has still left the duty on tobacco open to most of the objections above mentioned. So great is the variation in the different qualities of raw tobacco, that the usual untaxed price of some scarcely ever exceeds nine pence per lb. whilst that of others never sinks below as many shillings; so that the reduced indiscriminating duty of 3s. per lb. inflicts a burden of 400 per cent. on the needy consumers of *cheap* tobacco, and of 33 per cent. on the wealthier purchasers of *dear*—a burden on those who consume it as a necessary, *twelve* times heavier than on those who buy it as a luxury—400 per cent. for use; 33 per cent. for pleasure. The advantages afforded to the smuggler by so heavy a tax, have been much abated, (as Mr. Robinson conceives,) in consequence of this reduction from 4s. to 3s. per lb., and that more particularly in Ireland, where this illicit traffic has hitherto been least easily repressed. It is difficult, if not impossible, to ascertain the diminution of smuggling, otherwise than from the increased consumption of the goods of the legal trader. If this test be applied in the present instance, we shall find that the difference is not sufficiently great to warrant Mr. Robinson's conclusion. The statement published by the House of Commons, is as follows:—

|                | Jan. 5, 1825. | Jan. 5, 1826. | Increase.  | Rate of increase about |
|----------------|---------------|---------------|------------|------------------------|
| England.....   | 11,584,059    | 12,700,784½   | 1,116,725½ | one-tenth.             |
| Scotland ..... | 1,596,276     | 1,900,412     | 405,136    | one-quarter.           |
| Ireland .....  | 3,749,732     | 4,160,049     | 410,317    | one-twelfth.           |
|                | 16,929,067    | 18,761,245½   | 1,832,178½ | one-ninth.             |

Hence it appears that the increase in Scotland, where the illicit traffic is least extensive, exceeds the increase in Ireland, where it is admitted to be most prevalent, in a proportion exceeding 3 to 1. It would, in truth, be idle to imagine that a material difference would occur in the illicit trade, by any reduction which should leave the existing duties at 400 or

500 per cent. If any diminution have occurred in the quantity of smuggled tobacco, it must have been in those qualities in which the duty does not exceed 40 or 33 per cent. We doubt much whether the diminution of the tax on the inferior qualities will have affected, even in the

\* Parl. Paper—(Commons).—No. 197. 1826.

slightest degree, the price of the smuggled tobacco. The price of smuggled goods is regulated by the same competition which determines the prices of the fair trader: the goods of the smuggler are sold the lowest possible price, which will afford the smuggling profit. Now we know that many commodities, of which the illicit importation is both more dangerous and difficult than that of tobacco, are the objects of extensive smuggling, although charged with duties not exceeding 30 or 40 per cent.: but if 30 or 40 per cent. be sufficient to call the smuggler into the market, with what probability shall we look for a decrease in smuggling from any reduction in a duty, by which its total amount is left at 400 per cent.—at six or seven times above the level of the smuggler's duty. In fact, the inconsiderable revenue obtained from tobacco, is so disproportioned to its consumption, as to afford sufficient proof that the far larger part of the market, especially in Ireland, is supplied by the smuggler. Nothing but an extensive reduction of the duty can remedy this evil. If fixed duties were imposed in proportion to the value of the article, even although the tax were left as high as it is at present on the better qualities, it is probable that the revenue might suffer but very slightly; the quality, which at present is the principal subject of the illicit trade, would be put on the same footing as that from which the present revenue must be principally derived. The legislature would then be enabled to proceed by certain steps, so as just to withdraw the commodity from the hands of the smuggler, and to make the whole consumption productive of revenue, at the same time that it would confer an important benefit upon that class of consumers upon whom all taxes fall with peculiar severity, and who feel a trifling reduction in price as a sensible advantage.

A singular dispute arose in the course of the debate, concerning the effect of the recent remission of the taxes, which we noticed last year, and one of which—the tobacco duty—we have again thought proper to allude to. The Chancellor of the Exchequer, casting up in his speech the sum of the taxes repealed since the year 1816, and finding that they amount to 27,522,000*l.* insists upon this result as a triumphant answer to Mr. Hume, who had asserted

upon a former occasion that as much *was taken out of the pockets of the people*, since the reduction of taxation, as before. It is an observation of daily occurrence that the diminution of duty upon an article has a tendency to extend its consumption, sometimes so extensively as not only not to diminish, but actually to increase the revenue. In such a case, it is idle to deny (with Mr. Robinson) that the sum taken from the pockets of the people, *in the shape of taxation upon that article*, remains unaltered: but it is equally idle (with Mr. Hume) to adduce such a fact as an imputation against the minister. Putting aside considerations of the uses to which revenue is destined, the duty of the Chancellor of the Exchequer is to raise that revenue from the people in the least burdensome way. A reduction of duty on a commodity unattended by any decrease in the revenue arising from it, accomplishes this object with admirable success, for this increased consumption must be accompanied by a diminished consumption of some other article, or it must be produced by a diminution of smuggling in the article paying the reduced duty; in both cases the benefit is obvious and important: in the first the community are not confined to the use of some particular commodities by the arbitrary decision of the legislature; and in the second, the whole consumption is made available for the purposes of the revenue, and the demoralizing effects of illicit trade prevented. In neither case is the sum taken from the pockets of the people diminished or augmented, but in the former it is more easily borne, and in the latter the gross revenue is increased. As a diminution of revenue consequent upon increased duties is a matter of serious blame against the minister, so is it matter of praise that he has selected the subjects for reduction with so much judgment as to augment the revenue with reduced duties\*.

\* Mr. Robinson's ideas are by no means constantly clear upon the subjects of his department. He observes, for instance, that the increase of certain articles in the revenue, "shew that there is that progressive power of consumption in this country, which is indispensable to her greatness, and which forms the most convincing proof of her vigour, and which has hitherto enabled her to meet and overcome difficulties the most formidable, and on which he relies for similar success in future."—(*Ante*, p. 143.) For consumption read production, and

It would be a matter of sincere satisfaction if this were the only questionable passage in Mr. Robinson's speech.

But if, in criticising this subject last year, we felt it our duty to commend the clear exposition, arrangement, and sound reasoning of Mr. Robinson's speeches; it is no less necessary on the present occasion to censure him for the absence of all these merits in the speech of last session. One passage, however, demands peculiar notice, as an answer, by anticipation, to the expected attack from Mr. Hume: the attack consisting in a complaint of the amount of taxation, and a charge against the ministers on the score of economical reform. With respect to the question of patronage, Mr. Robinson answers thus:

"When applications have been made to me on such a subject, I have felt no difficulty in saying, I am really very sorry I have nothing to give you; we have no spare offices, no spare money: we have reduced every thing to the lowest point. We cannot put any individual into a public situation, who is either too old, or too young, or too idle to do his duty. I can recommend to an office under Government, only the man who is competent to fill it properly; if you are not competent, I am very sorry for it, but you cannot come in: this is the language which I and others invariably hold on such occasions."

Had the Chancellor of the Exchequer stated, that the ministers had made every reduction in the way of supernumerary and over-paid places, which was consistent with their retaining office—every reduction which those who govern them, and the nation, would permit: that to have proceeded further, would have deprived the country of at least a well-intentioned ministry, without accomplishing the object in view: the statement would have been honest, and the defence complete. What they are, in their present shape, it is unnecessary to describe. No spare officers—no spare money—every thing reduced to the lowest point—merit the only recommendation to office, and influence of connexion rendered useless:—Such is the state of purification which co-exists with a civil expenditure of twenty millions—with

the passage is both intelligible and (partly) true. Power of consumption, forsooth! Why every beggar in the kingdom has a power, and a wish to consume as great as that of majesty itself. Were their power of production equal to their power of consumption, the golden age would be revived.

\* *Ante*, p. 143.

a church, an army, a navy—with every easy office in every public department, overcharged with the off-sets of aristocracy:—And such is the language which the Chancellor of the Exchequer deems expedient (for he can scarcely be in earnest as to the facts) to be holden in the House of Commons!

### Paper Currency.—Commercial Distress.

THE opening of Parliament in February, 1826, found the nation still in the throes of one of those commercial revulsions, to which all commercial countries are liable, but which, partly from the univalued magnitude of our commercial transactions, partly from vicious legislation, are more frequent and more violent in our own country than in any other.

This great calamity engaged the immediate attention of Parliament, and led to the adoption of certain legislative measures, into the expediency of which we shall now inquire. Before, however, we can be competent to pronounce upon the efficacy of the supposed remedies, we must be sure that we clearly understand the cause of the disease.

The proximate cause of the commercial crisis was speculation. It is not here intended to stigmatize all speculative transactions. Among the transactions so designated, are to be found many of the most useful operations of commerce. By speculations, we understand all mercantile transactions attended with more than ordinary risk: by rash speculation, those in which the risk is great, and the prospect of gain not a sufficient equivalent. The years 1824 and 1825 abound in speculations of this latter description. Very rarely, at any former period, had mercantile miscalculations been carried to so great a length. A vast majority of these enterprises failed; but not until for the purpose of carrying them on many persons had come under engagements, which nothing but the success of the speculation could enable them to fulfil. The speculations proving unsuccessful, these persons became insolvent; and their ruin drew after it that of many others, who had not speculated, but who were dependent, for the means of fulfilling their engagements, on the payment of engagements by persons who had.

Speculation, then, was the cause of the revulsion. But what was the cause of the speculation? This is evidently a most important question; and it is one which we shall find the means of answering without much difficulty. The cause of the late speculations, as of most former speculations, was anticipated deficiency in supply.

This solution will appear strange to those who imagine that the events of last year were something peculiar and unprecedented—something so entirely novel that they could not have arisen but from causes which had never been experienced before. This is an opinion, however, which can be entertained by no one who is even moderately conversant with our commercial history. Not to look back to the calamitous periods of 1784 and 1793; the present is the fourth commercial revulsion of the same kind, which has happened within the last sixteen years alone. The first took place in 1810 and 1811; the second in 1814 and 1815. Both were preceded by an immense increase of speculation. The same phenomena occurred, though to a less terrific extent in 1819\*.

There was, it is true, the appearance of more speculation at the recent period, than at any of those above cited; because there were more *projects*: and the projects, or bubbles, as they were called, although they in reality bore a very small proportion to the totality of the speculations, were almost the only part of them which the more mercantile portion of the public saw, or dreamed of. But we ascribe little agency to these projects, comparatively speaking, in producing the distress. The speculations in shares extended only to a small portion of the mercantile community. Moreover, the projects which were really bubbles, that is, which were fraudulent, and were never intended to be prosecuted, mostly burst while the amount of the instalments which had been paid was as yet moderate; generally, we believe, not exceeding 1*l.* or 2*l.* per share. Of the *bonâ fide* projects, a great proportion still continue to be carried on; and may yet turn out, some of them undoubtedly will turn out, advantageous

investments of capital. During the general infatuation, exorbitant premiums, it is true, were given for shares in the more promising of these undertakings; and to those who purchased when shares were at the highest, the profits of the enterprise will never yield any thing like an adequate remuneration. It could, however, be no secret to the most sanguine projector, that the returns, even to the most successful of these schemes, must be distant. With this knowledge, it is extremely improbable that the honest purchaser should have invested a larger sum in shares, than he could afford, at least, to wait a considerable time for the repayment of. And as for those who bought shares at a price which they knew that no rational calculation would warrant, in the hope of finding dupes, or knaves of their own stamp, to purchase them again at a further advance, we cannot say we greatly regret that their plans should have been thwarted, though it be at the expense of some loss and some inconvenience to themselves.

The speculations, by the failure of which so large a portion of the mercantile community has been brought to the brink of ruin, and so many actually ruined, were of a different kind. Their character was, not the investment of capital in new enterprises, but an enormous and improvident extension of dealings in many of the established lines of business. The proper name for these speculations is *over-trading*. The phenomena of over-trading are so little understood out of the mercantile circles, that a short exposition of them will be read with interest; and without it, we fear that much of our subsequent reasoning would scarcely be intelligible.

It is well known that there are dealers who are constantly upon the watch for every symptom either of an actual or a prospective increase of demand, or deficiency, in the supply of any article of general consumption. The moment any such symptom is perceived, these dealers come into the market and purchase, in order to profit by the rise of price which will take place when the deficiency, or the increase, of demand becomes known. Their purchases produce an immediate rise. The articles hence appear to be *looking up*: expectation is excited that they will rise still higher; and additional speculative purchases are made upon this prospect. In

\* The reader who desires to possess fuller information concerning the events of these remarkable periods, will find many valuable details in Part I. of Mr. Tooke's able and important work on High and Low Prices.

Sess. 1826.

this manner, the prices of the articles which are the subjects of speculation, undergo a progressive rise; which will be greater or less, according to the strength of the impulse which has been given to the spirit of speculation. If the expected increase of demand, or deficiency of supply, be moderate, and not calculated to inspire great hopes of immense or rapid gains, the rise of price is probably not more than sufficient to call forth the required addition to the supply, and to produce, in the meantime, the necessary limitation of consumption. In this case, no loss is sustained, and the effects of the speculation are purely beneficial. But if the expected increase of demand, or deficiency of supply, be so considerable, as to produce anticipations of a great and rapid rise of price; and if these anticipations extend to several articles of general consumption at once; they give rise to what is frequently, though erroneously, called *general over-trading*. The few who watch prospectively the signs of future supply and demand, anticipating a great rise of price, make considerable purchases. These purchases produce a considerable immediate rise; and this in its turn tempts the many, who look no further than to the immediate turn of the market, to purchase in expectation of a still greater advance. These speculative purchases produce the very effect, in anticipation of which they were made. A progressive and rapid rise takes place; the holders of all the articles to which the speculation extends, appear to be making fortunes; and a general rush of capital takes place into those employments. Increased speculative purchases raise the price far beyond what the prospect of deficiency, or of increased demand, will justify. Immense orders are sent abroad, if the articles belong to the class of imported commodities; thus raising their price in the foreign market: if they be articles produced at home, equally extensive orders are given to our own manufacturers. Every one calculating upon being before-hand with all his competitors, provides himself with as large a stock as he thinks that the market will take off; not reflecting that others, equally with himself, are engaged in adding to the supply, nor calculating upon the fall of price which must take place as soon as this increased quantity is brought to market. The deficiency

is soon changed into an excess. The first who come into the market realize at the high prices, and make, or appear to make, enormous gains. An additional stimulus is thus given to the frenzy, and prices at length rise to such a height as to induce a considerable number of the holders to think of realizing. Then commences the fall of prices. This operates as a signal to all the other holders to hurry their stocks to market, in order to secure what they can before the price relapses to its original level. The recoil is hence almost instantaneous. Not only do prices fall to the level from which they rose, but, from the increased quantity which has been imported or produced, they fall lower; commonly much lower. Of those who have bought largely at the high prices, a great proportion are ruined. Those who have contracted to take large additional quantities from the manufacturers, are unable to perform their contract; and the stocks remain in the warehouses of the producers, many of whom become unable to fulfil their engagements, or obtain the means of fulfilling them by forced sales, at an enormous loss. The failure of a few great commercial houses occasions the ruin of many of their numerous creditors. A general alarm ensues, and an entire stop is put for the time to all dealings upon credit: many persons are thus deprived of their usual accommodation, and are unable to continue their business. It is unnecessary to multiply details.

Such is the *rationale* of a period of over-trading. Every merchant, who remembers the commercial revulsions of 1810-11, and 1815-16, will testify that such are the events which always follow the opening of new markets, the expectation of deficient supplies, every thing, in short, which excites a confident hope of rapid gains. The additional supplies necessary are enormously over-estimated, enormous over-production and over-trading take place, the market is glutted, the holders suffer immense losses, many of them become insolvent, and their ruin draws along with it the ruin of many among the many others, who have given them credit, confiding in the enormous wealth which they appeared to have the power of realizing during the continuance of those high prices of which their own purchases were in a great measure the cause.

The speculation and over-trading of the years 1824 and 1825, had their origin in a state of circumstances precisely similar. They are thus explained by Mr. Tooke, in his work intitled "Considerations on the State of the Currency:"

"The close of each year is the period at which, by annual custom, the stocks of goods on hand, and the prospects of supply and consumption for the coming season, are stated and re-examined upon by merchants and brokers, in circular letters addressed to their correspondents and employers. By these circulars it appeared, that of some important articles the stock on hand fell short of that at the close of the preceding year. From this the conclusion was more or less plausibly deduced, that the rate of the annual consumption of these articles was outrunning the rate of the annual supply, and that an advance in price ought to take place; at the same time there were, as in the case of cotton and silk, confident reports of failure of crops, or other causes, which would inevitably diminish the forthcoming supply. Expectation of scarcity was thus combined with actual deficiency in exciting the spirit of speculation. . . . The impulse to a rise having been given, and each succeeding purchaser having realized, or appearing to have the power of realizing, a profit, a fresh inducement appeared at every step of the advance, to bring forward new buyers. These were no longer such only as were conversant with the market; many persons were induced to go out of their own line, and to embark their funds or stretch their credit, with a view to engage in what was represented to them by the brokers as a certain means of realizing a great and immediate gain. Cotton exhibited the most extraordinary instance of speculation carried beyond all reasonable bounds. Silk, wool, and some other articles, in which some advance was justified by the relative state of the supply and demand, became the subject of a speculative anticipation, and advanced much beyond the occasion."

It is evident, that what is lost to one person, in these fluctuations, is gained by another. In the view of national wealth, therefore, except to the extent of that portion of the gain which falls to the share of foreigners, together with the loss of interest on the capital which lies unemployed during the stagnation, the evil of such vicissitudes is small. In the view of national happiness, it is undoubtedly great; and the legislature, therefore, would be highly culpable in not applying a remedy, if a remedy were within the reach of legislation. But the cause of the evil is one which legislation cannot reach—the universal propensity of mankind to over-estimate the chances in their own favour. While this propensity subsists, every event which stimulates hopes, will

give rise to extensive miscalculation; and every miscalculation upon a sufficiently extensive scale, will terminate in the ruin of multitudes. All that we are entitled to hope is, that as the world grows older it may grow wiser; that the time may come, when, in addition to reading, writing, and arithmetic, it may be thought not unnecessary for a young man who enters into a merchant's counting-house, to possess some knowledge of the circumstances which regulate the prices of commodities; that when improved education shall have been followed by improved mental habits, and when the liberation of trade from the restraints under which it now labours, and which so greatly aggravate all fluctuations, shall have given sober calculation a solid ground to rest upon, sober calculation may gradually take the place of gambling; that traders may one day acquire sufficient prudence to abstain from risking their own property in rash speculations, and sufficient probity to abstain from risking in any speculations the property of others.

His Majesty's Ministers saw the subject in another light. The root of the evil, in their opinion, lay much nearer the surface. According to them, the over-trading, and the revulsion which succeeded it, were either produced, or greatly heightened, by the system of our currency. Two laws were accordingly passed, by means of which, changes of considerable importance were made in the system of our currency. By the one, it was enacted, that no promissory notes, under the value of five pounds, should circulate beyond the 5th of April, 1829. By the other, the exclusive privileges of the Bank of England were so far curtailed, as to permit the establishment, at a distance not exceeding 65 miles from London, of banking associations with an unlimited number of partners.

The observation which first suggests itself, on the subject of these specimens of legislation, is, that they were enacted in a hurry. Legislation, like most other kinds of business, when it is performed in a hurry, is not very likely to be performed well. When, indeed, an enactment does no more than carry into practice, principles, either obvious in themselves, or universally admitted by all well-informed persons who have directed their attention to the subject; provided, also, that the applicability or

inapplicability of those principles to existing circumstances, depends upon facts, all of which are so obvious and familiar, as to be in no danger of being either mistaken or misinterpreted; it may then be safe to legislate, even in a hurry: And we do not deny that there may be dangers so imminent, as to justify the adoption even of an uncertain remedy, provided it be an immediate one. But no such danger existed in the present case. Nor was the purpose of this hasty legislation the mitigation of immediate suffering; which might have been some excuse for precipitation. It was never contended that the proposed measures had any tendency to alleviate the existing distress. It was even admitted, that the small-note measure was calculated to aggravate the distress, by discrediting an important part of the circulation; by which means the currency was further contracted, and additional force given to that recoil of prices, which was the immediate cause of the distress. As little could it be said that the suppression of the small notes was a measure borne out by received principles. Its proposers themselves never asserted, that the received principles were in its favour. They fully admitted that it was repugnant to received principles; but maintained that those principles, however plausible in theory, had been disproved by recent experience. With these representations before it, Parliament knew so little, or cared so little about received principles, that it was quite contented to set them aside on mere hearsay; being perfectly satisfied with the *word* experience, without giving itself any concern about the *thing*, or taking even so much trouble as would have been necessary to ascertain whether the supposed facts, on the ground of which it was thus called upon to renounce its strongest convictions, were really facts, or suppositions of the most unwarranted kind.

First appearances, indeed, had been sufficiently in favour of the ministerial theory, to enlist in support of it a large proportion of the public of all ranks, and of the public press. Long before the meeting of Parliament, a loud cry had been raised for the suppression of the small notes. Those who raised this cry, had seen, of the circumstances of the case, just so much as they could not

help seeing, namely, the failure of banks, and the distress of many poor persons, who held the notes, especially the small notes, of those banks. To have seen thus much, required nothing but eyes; to see any thing further, required eyes, and a mind, capable of directing those eyes. All, therefore, who possessed the former, but were destitute of the latter, unanimously agreed, that the small notes ought to be suppressed. Uncultivated minds, minds unaccustomed to dwell upon any ideas beyond those of the immediate objects of sense, always jump at once from the good or evil which they see or feel, to the physical substance, the visible or tangible object, which sight or touch exhibits to them in the character of an instrument. In this point of view, there is no denying that the small notes were the cause of whatever losses were sustained by the holders of those notes; for certain it is, that, had there been no small notes, no person could have lost any thing by holding them. But we submit, that whatever was thus lost, was lost not by any pestilential quality in the piece of paper itself, but simply by the *insolvency* of the issuers. If, therefore, it be practicable to take perfect securities, that no person shall issue notes who does not possess property more than sufficient to meet their amount; it does appear, that the very possibility of loss to the holders of the notes would be completely obviated. That it is practicable to provide such securities, we have never yet found any person to deny; and something, though by no means enough, was done by one of the ministerial measures, towards providing them. Those members, who introduced into the discussion on the small notes, pathetic descriptions of the misery occasioned by the failure of a country bank, might have reflected that the debate on the Bank Charter Act was the occasion on which such descriptions would have been in place.

We do not accuse ministers of having acted upon views so superficial as those which, we are persuaded, alone influenced the ignorant part of the public in the cry which it raised against the small notes. Ministers were well aware that the question turned upon far other considerations than these. But although they confessed that they were abandoning the established principles, they do

not seem to have reflected, that to justify the abandonment of established principles, the most perfect knowledge that was attainable was not more than enough. After ascertaining the few facts which could be got at by merely ordering a parliamentary return, they took every other fact for granted, which the establishment of their theory required.

Take, for example, the supposed fact, to which so much importance was attached; that the currency had been increased for some time previous to the commencement of any efflux of gold. No fact ever admitted more easily of being proved or disproved before a committee; but ministers had reasoned themselves, or rather had been persuaded by others, into a belief that it *must* have been so; and, this settled, it was not considered needful, though it were only for the purpose of silencing adversaries, to ascertain whether or not, in point of fact, it *had* been so. Take next the assumption, that the small notes had operated greatly to facilitate the speculation and over-trading of 1824 and 1825. Against this supposition no less than five counter-suppositions might be suggested; not one of which was met, or *could* be met satisfactorily, without that inquiry into the facts, which it was not thought necessary to institute. The banks which issued small notes may not have facilitated speculation at all. Or they may have facilitated it by their large notes, and not by their small ones. Or they may have facilitated it by their small notes, but, if the small notes were suppressed, they might have it in their power to continue facilitating it by their large ones. Or they might have power to facilitate it by means of some substitute for notes, and without the assistance of notes, large or small. Or, lastly, they may have facilitated it by their small notes, and may not have power to facilitate it by any other means; but the utmost facility which they may be able to afford to it may not be so considerable, as to outweigh the counterbalancing advantages of a small note circulation.

Had Parliament exerted all the means which it possessed of ascertaining every fact material to the case, the discordance of the facts with the theory would probably have rendered any other mode of combating it superfluous. These means, however, were not exerted; and we must now proceed to examine into

the validity of the theory, by a method more laborious in the process, though equally certain in the result; by reasoning from the nature and properties of currency and trade. We are persuaded, that even by this means, we shall be able to disprove the theory in every one of its essential parts, and by arguments so cogent, that the non-production of so many facts will only injure the simplicity, without detracting from the conclusiveness, of our reasoning.

We shall begin by exhibiting, in one view, the whole of the case which was attempted to be made out against the small notes. It will be seen that the principal arguments were, in substance, arguments, not against a small-note currency in particular, but against a paper currency of any description. The advantage which, it was stated, would result from the suppression of the small notes, was, that there would be less paper, and more gold: and all which was said against the small notes resolved itself into this, that paper money was bad, but that the worst sort of paper money was the small paper.

The following, then, were the objections to a paper currency.

1. That even in non-speculative periods, a paper currency, although convertible into specie, by law, at the option of the holder, is yet liable to *over-issue*.

2. That in speculative periods there is always an over-issue, which, by producing a general tendency of prices upwards, heightens and prolongs the spirit of *speculation*: That, when at length the revulsion arrives, the destruction of the extra paper which has been called into existence by the speculation, renders the recoil of prices more violent, and for this reason more destructive: And that these circumstances have actually taken place during the last three years.

3. That when the paper currency is suddenly increased, (at least if it be a paper currency issued, as ours is, chiefly through the medium of loans), a fall takes place in the *rate of interest*, which, by diminishing the incomes of the owners of small capitals, induces them to engage in hazardous speculations: and that this also actually happened during the last three years.

We shall now proceed to examine the evidence of these three propositions, one by one.

1. *Over-Issue*.—The first proposition is, That even in non-speculative periods, a paper currency, although convertible into specie at the option of the holder, is yet liable to over-issue.

The whole force of this argument lies in the word *over-issue*. Over-issue, however, is a thing oftener talked of than understood. What is meant by over-issue? Unless there be some standard by which it may be judged what is over-issue, and what is fit and proper issue, it cannot be determined whether a paper currency is liable to over-issue or not.

Over-issue, is any issue whatever, which *depreciates* the currency. We are aware that we are not using the word depreciation in its strict sense. We use it as a short expression for *lowering the value* of the currency; or, what is the same thing in other words, raising general prices. We assert, then, that however extensive the issues may be, unless the value of the currency is lowered, there is no over-issue. If this be doubted, which we can scarcely believe, let the reader merely revolve in his mind what possible harm can arise (while the issuers are solvent) from any issue of paper which does *not* raise prices, or lower the value of the currency.

This being assented to, we next ask, how the value of the currency can be lowered by any issue of paper *which displaces an equal quantity of gold*? If the answer be, as it must be, *not at all*; and if it be further admitted, as it universally is, that *every* issue of paper displaces an equal quantity of gold, so long as there is an equal quantity of gold in the circulation to displace; the inference must be, that while there is an ounce of coined gold in the country, there is proof positive of the non-existence of any over-issue.

Most assuredly the speakers in Parliament did not state the case to themselves in this way. In the minds of most of them there seemed to be a disposition to regard any issue of paper whatever as an over-issue. Loud and incessant were the complaints, that one-pound notes and sovereigns would not circulate together. The Bank of England and the country banks, were charged with a dereliction of duty, in not contracting their issues when the exchanges indicated that they were driving gold out of the country. Now, if it be a sufficient objection against paper that it displaces gold, there ought

not to be any paper whatsoever. Every note of the thirty or forty millions of paper which are now circulating in this country, displaced, when it was first issued, an equal quantity of gold. This is so obvious, and now so perfectly familiar to the merest tyro in the theory of money, that it does not stand in need either of illustration or of proof.

Since the paper, which costs nothing, performs all the functions of currency as well, the large notes indeed much better, than gold; while every sovereign exported causes the importation of a sovereign's worth of productive capital, or consumable produce; the country gains, by the substitution, the whole value of the gold. There is a gain to the currency in cheapness, while there is no loss in steadiness of value. The currency is altogether in a more perfect state than before. When an issue of paper *replaces* to displace a corresponding quantity of gold, then, and not till then, is the currency depreciated; then, and not till then, is there an over-issue. But this, by universal admission, cannot happen while the Bank continues to pay in specie on demand.

The above argument may be thus briefly recapitulated:

No issue of paper can be called an over-issue, which does not depreciate the currency:

It cannot depreciate the currency, if it displaces as much coin from the circulation as it adds paper:

By universal admission every issue of paper has this effect, so long as there remains a single sovereign in the country:

Therefore, so long as there remains a sovereign in the country, there has been no over-issue.

Thus far, the argument has nothing in it particularly complicated, or difficult of apprehension. We must here, however, observe, that to understand the rest of the discussion, the reader must keep constantly in view the principles already established; and, to be sure of keeping them in view, must dwell upon them before proceeding further, till they are quite familiar. Nothing less will be just to the writer, or entitle the reader to expect either profit or pleasure from the ensuing part of the argument.

With this remark we resume the thread of the argument.

An objection has been made to the above reasoning. Admitting that every

million of notes issued causes the export of a million of coin, it is contended that this effect does not take place till after a considerable interval; during which interval the currency is actually increased to the extent of the extra million; its value, consequently, depreciated to that extent; and whatever bad consequences arise from a depreciation of the currency (of which speculation is asserted to be one) take place during that interval.

If the matter of fact involved in this objection were correct, the inference from it would be indisputable. If it be true that a considerable interval must elapse before the increase of the currency is carried off by the export of gold, all the evils arising from a depreciated currency must be experienced in the meantime. We maintain, however, that the interval is very inconsiderable. And upon this point we join issue with the opponents of a paper currency.

We shall proceed to state the reasons which have been assigned for the opinion that a considerable time must intervene between the issue of paper and the consequent export of gold. These reasons will be taken from the ablest publications on that side of the question. We should have preferred to take them from the speeches in Parliament, had the speeches in Parliament afforded them. But the only reason which was urged in Parliament was contained in one word—*Experience*: a reason, which, so long as we are not informed *what* experience, proves nothing whatever, except the ignorance of its propounder.

The reasoning of those, upon the authority of whose publications Parliament adopted this opinion, was as follows:

Until the exchanges have turned sufficiently against us, or, in other words, until foreign bills have risen to a sufficient premium, to yield a profit on the exportation of the precious metals, they will not be exported. But the exchanges turn against us, only when we have a balance to pay to foreign nations. The only process, therefore, by which the issue of paper can cause the exportation of coin, is the following. It first lowers the value of money, and raises prices. In so far as this rise of prices affects exported commodities, it reduces the profit upon their exportation. In so far as it affects imported commodities, it increases the profit upon their importation. Importation is thus encouraged,

and exportation checked; the imports exceed the exports, a balance becomes due, the exchanges fall, and gold is sent abroad. Every step of this process, it is asserted, requires some time; and in particular, a considerable time must elapse between the sending out orders for additional imports, and the period when payment for them has to be made. During this interval, therefore, the currency will be depreciated.

Our answer to this objection is as follows:

That *some* time is required to effect the process by means of which a quantity of gold is carried off equal to the paper which has been issued, cannot possibly be denied. But it is evident that, for the purposes of the present inquiry, the only material question is, *how much*? If it requires only a few days, or even one or two weeks, to carry off the increase of the currency, any depreciation which can take place during that interval, is of small moment. But if the depreciation continues for many weeks, or months, its consequences may be very serious indeed. Let us therefore consider by what circumstances the length of the interval will be regulated.

The effect of the issue of paper, is to raise prices. We shall not here inquire what period of time, if any, would elapse, before the rise of prices took place. Suffice it to say, that until it has taken place, the currency is not depreciated, and therefore no evil is as yet produced by the issue. But as soon as there occurs a rise in the price of any of the great articles of import, immediate intelligence is sent off to Paris, or Hamburgh, and the merchants of those places immediately make their arrangements for profiting by the rise. The celerity with which the operations of commerce are performed when there is an adequate motive for so performing them, is matter of universal notoriety. Extensive shipments would probably be made within a week after the receipt of the intelligence. Nor is it correct to say that these shipments would not affect the exchange until the goods came to be paid for by the English purchaser. They would affect it immediately. There are few merchants who would be inclined to wait till the goods were sold, for a return to their capital. There are many who could not. These would imme-

diately draw upon their correspondents, or agents, in London, to whom the goods had been consigned, and carry the bill to a bill-broker in Paris or Hamburgh, to be cashed. This would bring bills on London to a discount; or what is the same thing, the exchange would rise. The next post would carry this intelligence to London, and without a day's interval the London exchange would undergo a corresponding fall.

That the exchange cannot rise on one side of the channel without instantly falling on the other, it is quite unnecessary to prove to any mercantile man. But to those who are not familiar with the facts, we will explain in what manner the variation, which had taken place at Paris, in the exchange between the two countries, would communicate itself to London.

The speculators on the exchanges, hearing that bills on London were selling in Paris at a discount, or, in other words, that English money could be purchased at Paris for less than its worth, would immediately send orders to their Parisian correspondents to invest as much money as possible in bills upon London, at the favourable rate of exchange. In directing their agent to make these purchases, they, of course, must, at the same time, supply him with the means. For this purpose they would go to a London bill-broker, and demand bills upon Paris. This demand would raise bills to a premium, in a word, lower the exchange.

Instead of a long interval, therefore, there is a very short interval between a depreciation of the currency and a fall of the exchange. Two days carry to Paris information of the rise of prices; eight or ten days, at the utmost, suffice for the shipment of goods; bills are immediately drawn upon London for the amount; the exchange rises at Paris, and no sooner is this known in London, than a corresponding fall in the exchange takes place there. As soon as the fall in the exchange, or in other words, the premium on bills, becomes sufficient to cover the expence of remitting gold, gold is exported for the sake of drawing against it and gaining the premium.

The expence of remitting gold to France does not amount to one per cent: a depreciation of the currency, therefore, to that extent, would be sufficient, after an interval of a few days, to cause the export of gold. The slightest

excess above the expense of transit, is a sufficient motive to those who speculate on the exchanges; a class of men proverbially keen-sighted, and who are contented with very small gains, on account of the rapidity and certainty of the return. The exportation would in fact begin even *before* the exchange yielded such a premium as would be necessary to render the speculation a profitable one. There are transactions in anticipation of profit, as well as transactions for immediate profit, in this line of business as in others. To give an instance: Mr. Haldimand, in his Evidence before the Commons' Committee on the resumption of cash payments in 1819, mentions that in the October preceding, when France had engaged for very large payments to foreign powers, "the Paris bankers, anticipating a great demand for bills upon all foreign countries, were remitting specie to meet the drafts which they intended to negotiate to the agents of all those foreign powers, with a small advance upon their remittance."

Among the individuals who are constantly engaged in watching the minutest indications of possible profit in this line, it is sufficient to name Mr. Rothschild, in order to convince the reader that neither immediate nor prospective gains are in any danger of being overlooked.

Let us now recapitulate the substance of our argument against the first proposition.

The proposition was, that a paper currency admits of over-issue. We have seen, *first*, that there is no over-issue where there is no depreciation; *secondly*, that there is no depreciation, where the paper issued drives out of the country a corresponding quantity of gold; *thirdly*, that it always does this, while the Bank continues to pay in specie: and does so after an interval too short for the depreciation to be productive of any material inconvenience while it lasts.

Having thus, as we think, completely disproved in theory the proposition of our opponents, let us now revert to the phenomena of 1824-25: and though, for want of evidence, we cannot trace accurately the connexion of the events, we can prove at least, that what is known of them does not afford any ground for adhering to an opinion, the fallacy of which in theory has been so clearly shown.

The great increase of the currency

which took place previously to the commercial crisis, has always been ascribed, and with justice, to the speculations of that year. It will be shewn presently, that the prevalence of speculation always leads to an increase of the currency: in the meantime, as this is an admitted fact, we shall consider it, and reason upon it, as proved. The tendency to speculation first manifested itself in a more than ordinary degree, in the spring of 1824. It increased gradually during the remainder of that year, and reached its greatest height during the first three months of 1825. Now it was also in the spring of 1824, that the efflux of gold commenced. The exchanges turned decidedly against us in July of that year: And we have the authority of Mr. Tooke, (on whose part it may be regarded as an admission, since it makes against his theory), that a considerable amount of gold had found its way out of the country by other channels, some time previous to the turn of the exchanges. Here, then, is no proof that the exportation of gold does not take place till a considerable time after the increase of the currency. The evidence is not very conclusive; but such as it is, it makes against this opinion, not in its favour.

We may perhaps be told, that we do not make a fair statement of facts. It may be admitted, that the exchanges turned, by the time that the speculations had caused any increase of the currency. But the currency, it may be said, had been increasing in amount, for a considerable time previous to the speculations. The country banks had been extending their issues ever since the year 1822: and had increased them considerably before the spring of 1824. They are even in the habit of increasing their issues as corn rises in price: and yet, the increase never affects the exchanges, nor sends gold out of the country.

These facts are undeniable: and they lead to the consideration of a law of our currency, which has never been sufficiently attended to; this is, the dependence of its value upon the Corn Laws. A rise in the price of agricultural produce invariably increases the issues of the country banks. The notes of the country banks are chiefly issued in discounts, or other advances, to farmers and corn dealers. When the articles in which these persons deal, appear to be

rising in price, they apply to their bankers for greater advances, in order to obtain the means of holding back their stock till the price has reached its height. If the rise continues for some time, the farmers need greater advances, that they may be able to add to the supply; and all speculators in corn, at the higher prices, require a greater quantity of money to make their purchases. Add to this, that when corn is high, all persons whose property is corn can give better security, and can therefore more readily obtain whatever loans they require. In this manner the issues of the country banks are increased, and we admit, without affecting the exchanges, or driving gold out of the country.

We maintain, however, that this is not the consequence of our paper currency, but of those laws which injure us in so many other respects as well as this—our Corn Laws. We affirm, that the country banks could not thus extend their issues if the trade in corn were free; and that a similar extension will take place, even under a metallic currency, while that trade continues under restraint.

These assertions we shall now endeavour to prove.

A circumstance which must by no means be forgotten, is, that when commodities rise in price, it really requires an increased quantity of money to circulate them. When corn and other agricultural produce rise in price, more money, by some means or other, must be had in the agricultural districts; and if it be not permitted to be produced upon the spot, it will be sent from London. This will cause a diminution of the circulating medium in London, and a fall of prices there. As in other cases, so in this, a fall of prices will produce an increase of exportation. Under a perfectly free trade in corn, the increased exports would be paid for, as they naturally and properly should be, by that additional importation of corn which the rise in its price would occasion: there would, therefore, be no increase in the amount of our currency; it would only be differently distributed between town and country. Under a restricted corn trade, the case is widely different. Corn cannot be imported. Other imports will not be increased, but diminished, from the fall of their price in our market. In what, then, can the increased exports be paid for, but in gold? And will not this

gold be as real an addition to the currency, as the country paper? Gold will flow in, until the vacuum is filled, which was left in the London circulation by the country demands; since the balance between the exports and imports will not be restored until prices have again risen to their former level. The addition, therefore, to the currency, and the fall in its value, will be precisely the same in amount, whether under a paper currency, or under a metallic.

Let this general explanation of the process by which depreciation would be produced, even under a metallic currency, when corn was dear, should not be deemed sufficiently intelligible, we will now enter more minutely into the detail.

If, when corn is dear, there be need of additional loans in the agricultural districts, (which is the fact assumed by both parties as the basis of their arguments), the need would not be less under a metallic currency than under a paper. The farmers and corn dealers would still apply for increased advances; and as the country bankers are the great money dealers, to them the application would still be made. The country bankers, like the London bankers, would not cease to lend money, even though it were money manufactured by other people; and if they could not increase their issues, that would be no reason why they should not, if the security were good, increase their loans. Suppose then that they were prohibited from making loans in their small notes, in their large notes, or even in bills on London, they would not give up the point so long as any other medium was to be had; they would write to desire their agents in London to remit to them a sufficient quantity of Bank of England notes, or to exchange these notes at the Bank for specie, and remit the specie\*.

\* It may perhaps be objected, that the country banks would be more sparing in their advances to their customers, if they had to provide gold for the purpose. Under circumstances favouring the spirit of speculation, and thus tending to increase the general demand for loans, this would be perfectly true. But under the circumstances now supposed, it would not be true. If the country bankers would not make further advances to their customers when corn was rising, the London money dealers might and would. Except when there is a general spirit of speculation afloat, (or what is equivalent to it, an increased disposition to give credit), increased applications for loans from one quarter are always accompanied by diminished applications from an-

If the Bank re-issue these notes, which it may safely do, here is an increase of the currency, just as much as if the country banks had made the increase themselves. If it do not, prices fall, and gold flows in, by the process which we have already explained.

We have now, as it appears to us, completely disposed of that argument against a paper currency, which is founded upon the fluctuations to which it is supposed to be liable, in non-speculative periods. We have shewn, that there is only one case in which the amount of our currency, relatively to that of our commodities, can be increased, without turning the exchange against us, and causing the immediate abstraction of the superfluous part of the circulating medium:—that this one case is that of a rise in the price of corn:—and that, although in fact our currency rises and falls in amount, as the price of corn rises and falls, this is a fluctuation by no means peculiar to a paper currency, but common to every currency in a country where there are corn laws. It may consequently be added to the already long catalogue of the evils to which we are subjected by those pernicious enactments.

We are now prepared to pass to another head.

2. *Speculation.*—The second proposition is, That in speculative periods, if there be a paper currency, it is sure to be over-issued, and by producing a general tendency of prices upward, to heighten and prolong the spirit of speculation.

To this argument the same reply cannot be made as to the last. It would be in vain to say, that if the currency be increased in speculative periods, the exchanges will turn, and carry off the increase; for the increase of the currency

other. It is the articles that appear to be rising, which excite speculation, and produce a demand for loans among the dealers in these particular articles. But unless there be an increase of the currency, either previous or simultaneous, one article cannot rise unless another falls. While agricultural produce, therefore, is rising, other articles will fall, and while the farmers and corn dealers are calling for increased loans, there will be a cessation even of the usual demands from other quarters. A number of the London money lenders will thus have a portion of their capital set free, which they will be ready to lend to the farmers, either directly, or as would probably be more convenient, through the medium of the country bankers.

which is produced by speculation, generally to a certain degree extends itself to those countries with which our principal commercial transactions take place\*; and the exchanges, therefore, will turn against us, and drive out gold, not to the extent of the whole depreciation of our currency, but only to the extent of the difference between the foreign depreciation and our own. Conformably to this, it will be found, that the rise of prices during the speculative period of 1824-25 was so great, as to indicate an increase of the currency much above what would have been sufficient to drive out the excess, if the currencies of other countries had not been simultaneously increased; and although gold was at that very time flowing out at a most rapid rate, prices continued for many months at the same elevated range.

It cannot be denied, therefore, that our currency, as at present constituted, is liable, in speculative periods, to a fluctuation in value, of the nature of a depreciation.

What, however, may be maintained, and what we are prepared to shew, is, that to this depreciation a paper currency is not more subject than a metallic would be, if co-existent with so extended a system of commercial credit as exists in this country: that every country in which an extended system of credit exists, is liable to a depreciation of its currency in periods of speculation; and that the only effect of suppressing the country banks, would be, to cause the same depreciation to take place by means of credits of a far more objectionable description.

When it is supposed that paper-money is the cause of that depreciation of the currency which commonly takes place during periods of speculation, that property is overlooked, which speculation

possesses, of creating the medium in which it is itself carried on.

It seems to be supposed by persons unacquainted with business, and who have paid no particular attention to the subject, that the whole of the currency of this country consists either of coin, or of bank notes of some description, issued either by the Bank of England, or by country banks; and that the currency can be depreciated only by an undue increase of one or other of these media. This, however, is a mistake.

A large portion of the circulating medium of a commercial country consists of mercantile *bills of exchange*. And the functions of currency are discharged, and the need of currency superseded, to a very great extent, by mere *credit*.

In what manner bills of exchange perform the functions of currency, is shewn in the following passage, from a work which has contributed more than almost any other to the diffusion of sound principles on the subject of currency:—

“Let us imagine a farmer in the country to discharge a debt of 10*l.* to his neighbouring grocer, by giving to him a bill for that sum, drawn on his corn-factor in London for grain sold in the metropolis; and the grocer to transmit the bill, he having previously indorsed it, to a neighbouring sugar-baker, in discharge of a like debt; and the sugar-baker to send it, when again indorsed, to a West India merchant in an out-port, and the West India merchant to deliver it to his country banker, who also indorses it, and sends it into further circulation. The bill, in this case, will have effected five payments, exactly as if it were a 10*l.* note payable to bearer on demand. It will, however, have circulated in consequence chiefly of the confidence placed by each receiver of it in the last indorser, his own correspondent in trade; whereas, the circulation of a bank note is owing rather to the circumstance of the name of the issuer being so well known as to give to it an universal credit. A multitude of bills pass between trader and trader in the country in the manner which has been described; and they evidently form, in the strictest sense, a part of the circulating medium of the kingdom\*.”

It is evident that if our currency is capable of being depreciated by an increase of that portion of it which consists of *bankers'* paper, it is no less capable of being depreciated by an increase of that portion which consists of *mercantile* paper.

Independently of the direct substitute

\* The increased orders which our merchants send abroad in a period of over-trading, reduce the stocks on hand in the warehouses of the foreign dealers, and give rise to anticipations of deficiency in the supply. Anticipated deficiency is the most frequent of all causes of speculation: and the speculative spirit thus spreads to foreign countries. There, as here, it leads to an increase of the circulating medium, by an extended use of private paper and credit; and of course sinks the value of the currency, though rarely to so low a level as ours, because the derivative speculation rarely equals the original one in extent.

\* Thornton on the Paper Credit of Great Britain, p. 40.

for money presented by the employment of bills of exchange in making purchases,—an increased use of credit, whether given by means of bills or by mere entries in a book, also supersedes the use of money, though in a less direct mode, and consequently depreciates the currency. For the value of the circulating medium does not depend upon its quantity merely, but upon its quantity compared with the number and amount of the pecuniary transactions, in the settlement of which, it is employed. When, therefore, by an extended use of credit, the amount of transactions settled through the intervention of money is diminished, the same numerical quantity of money becomes relatively greater, and the value of the circulating medium is reduced.

It is well known that every increase of speculation is accompanied by an extended issue and circulation of mercantile paper, and with an extended use of credit. A period of speculation is invariably marked by great confidence. While prices are rising, every one seems to be growing rich, and on the strength of his supposed riches, every one finds his neighbour ready to give him credit. The speculator wishing, as the term implies, to extend his transactions, avails himself of this facility of obtaining credit, to the full extent which his speculations require. For most purposes, it is evidently more convenient to obtain a banker's note, for the purpose of making purchases, than to make purchases with a bill. Notwithstanding, however, the superior convenience of notes, a large increase is constantly made, in periods of speculation, to the quantity of mercantile paper performing the functions of currency. And the same, or a still greater increase, takes place in the amount of transactions which are settled without the intervention either of bills or of money; by mere transfers in a banker's or a merchant's books. These additions to the currency have the same effect in lowering its value, which a similar increase in the issues of the country banks would have.

It is this unavoidable increase of the circulating medium, which renders the recoil of prices so destructive after a period of speculation. The speculation itself would only raise the prices of those articles which were the original objects of speculation. But suppose an article to be sold and resold ten times, (no

uncommon event in speculative periods,) and suppose a bill to be drawn by each successive seller upon the purchaser, and all these bills to be added to the general mass of the circulating medium employed in making purchases: the effect which this must have in depreciating the currency, is most evident. By this depreciation, prices in general are raised, and commodities in general become objects of speculation\*. The fresh speculations produce a fresh addition to the circulating medium, and a fresh rise of prices; and so long as this lasts, every person in business appears to be rapidly making his fortune; until at last the articles which rose first and highest begin to fall, from the increased supply which the high prices have called forth, or perhaps from the mere desire of the holders to realize their gains. This causes the ruin of a large proportion of the holders of those articles: their paper becomes worthless, and ceases to circulate: the circulating medium being thus diminished, the prices of all other articles begin to fall at an accelerated pace, scattering ruin as the fall proceeds, and not only annihilating the paper of all the firms which successively become insolvent, but spreading a general distrust, which renders every one unwilling to take even the customary amount of private paper. The circulating medium is thus reduced, and prices con-

\* This was strikingly the case during the speculative mania which preceded the late revulsion. "The speculative anticipation of an advance was no longer confined to articles which presented a plausible ground for some rise, however small. It extended itself to articles which were not only not deficient in quantity, but which were actually in excess. Thus, coffee, of which the stock was increased, compared with the average of former years, advanced from 70 to 80 per cent. Spices rose, in some instances, from 100 to 200 per cent. without any reason whatever, and with a total ignorance on the part of operators of every thing connected with the relation of the supply to the consumption. In short, there was hardly an article of merchandise which did not participate in the rise. For it had become the business of the speculators or the brokers, who were interested in raising and keeping up prices, to look minutely through the General Price Currents, with a view to discover any article which had not advanced, in order to make it the subject of anticipated demand. If a person, not under the influence of the prevailing delusion, ventured to inquire for what reason any particular article had risen, the common answer was, 'Every thing else has risen, and therefore this ought to rise.'—*Traveller on the Currency*, p. 47.

sequently fall to a much lower level than that from which they previously rose.

All that fluctuation, therefore, in the value of the currency, which takes place in periods of speculation, may thus take place without the intervention of bankers' notes, by mercantile paper and credit alone.

In case it should be objected, that, if bankers' notes were abolished, at least that portion of the increase in the circulating medium would be prevented, which takes place by the increased issues of the country banks;—we will now shew, *first*, that if all bankers' notes were this day abolished, their place would be filled by an equal amount of mercantile paper; and, *secondly*, that, in periods of speculation, the same addition to the currency, which is now made by bankers' paper, mercantile paper, and mere credit, taken together, would be made by the two latter media alone.

To the first of these propositions we have the evidence of reasoning, and the evidence of fact; both of them of the most conclusive kind.

Country notes are issued in loans made by the country bankers to their customers. Loans would still be wanted by their customers if country notes were no more: and the country bankers would still be the persons applied to, in order to furnish them. If they furnished these loans in specie, they would be obliged not only to go to the expense of bringing specie from London, but to go to the expense of procuring the specie itself. They would, therefore, prefer to make the required advances by granting bills upon their agents in London, which bills being sent to London when due, would be exchanged without the intervention of money, by the operations of the clearing-house.

Accordingly, in Lancashire, where there are no local banks of circulation, bills on London, drawn by the bankers of that county on their correspondents, constitute the great mass of the circulating medium; as is proved by the following extracts from the evidence taken before the Lords' Committee on Scotch and Irish currency in the last session:—

*John Gladstone, Esq. M.P.*—"We sell our goods, not for payments in cash, such as are usual in other places, but generally at credits from ten days to three months, to be then paid for in bills on London at two or three months'

date: these bills we pay to our bankers, and receive from them bills or cash, when we have occasion for either to make our payments."—P. 216.

Again: "We have a considerable portion of large Bank of England notes in circulation: these are generally used for the payment of duties, and also for the purposes of remittance; but THE GREAT MASS OF OUR CIRCULATION IS IN BILLS OF EXCHANGE; sovereigns and smaller bank notes are only required for such objects as charges of merchandize, with duties, freights, and other items. I believe the circulation in bills of exchange is of great magnitude; the circulation of bank notes limited."—P. 219.

*Lewis Lloyd, Esq.* says, that before the notes of certain banks in neighbouring counties found their way into Lancashire, the currency consisted of "NINE PARTS BILLS OF EXCHANGE, AND THE TENTH PART GOLD AND BANK OF ENGLAND NOTES. I am inclined to think the bills of exchange bore a still greater proportion.

"The money (he was asked) which you suppose the manufacturer draws for wages, you are in the habit of paying in gold or Bank of England notes?—Yes, we are wholly.

"If he draws upon his deposit account, and it is supposed not to be for wages, how do you make payment upon that account?—It is generally made in bills of exchange drawn on London, but we accommodate his wishes as much as we can.

"Some of those bills of exchange are drawn from one part of Lancashire on another, are they not?—The bills of exchange called for by a manufacturer in such a case as that put, are mostly drawn in Manchester in his favour, and he uses them as he likes.

"Supposing a manufacturer in Manchester were to have a deposit account with you, and to make repeated demands for gold beyond what you thought necessary for the payment of wages, what would be your conduct?—We should say that we could not supply him. There is an understanding between the manufacturer and the banker: the manufacturer is to be supplied with what his wages require; but the ordinary demands of business beyond wages are usually paid in bills of exchange; and if he did not conform to that practice, we should complain, and object to his manner of conducting his account.

"Do those bills of exchange circulate from hand to hand in Manchester? Yes; when a bill is drawn in favour of a manufacturer, he endorses it usually to the person to whom he pays it, and the person to whom he pays it pays it again to another, and it goes on often till it is covered with endorsements.

"So that in fact it forms a part of the circulating medium?—THE PRINCIPAL PART.

"Have you not seen bills of exchange of that nature, for the value of 10l. with fifty or sixty names upon them?—Yes; with twice that number. I have seen slips of paper attached to a bill as long as a sheet of paper could go, and when that was filled, another attached to that."

Again: "Do you know any system adopted in Lancashire, from which there arises a check upon the quantity of those bills of exchange that may be issued?—The check upon them is their convertibility into Bank of England notes; that is, the facility with which they are discounted in the London market.

"That is the only check, is it not?—Yes it is." P. 299

Mr. Henry Burgess, a manufacturer at Leeds.—“What is the general circulating medium of Lancashire, independent of those promissory notes,” (of the Blackburn and Macclesfield banks?)—“THE GREAT MASS OF THE CIRCULATING MEDIUM OF LANCASHIRE, AS IN ALL the manufacturing districts in the North, is **BILLS OF EXCHANGE**; a part of the circulation is in gold and silver, and Bank of England notes.”

“Are not many of those bills of exchange for sums from 10l. to 30l.?—A great portion certainly from 10l. to 30l.”

“Are there many below 10l.?—No.”

“What proportion do you suppose those bills of exchange bear in value to the Bank of England notes and gold which circulate in Lancashire?—I should say that on the first of December last those bills of the value of 10l. and not exceeding 30l. amounted to FOUR-FIFTHS.”

“If you do not confine your answer to bills of exchange under 30l. what proportion does the gold and Bank of England notes bear to the bills of exchange in Lancashire?—I should say that the bills of exchange were MORE THAN TWENTY TO ONE. I have this day received a letter from a bank in Lancashire, who states the amount at much higher than that.”

“Have you any objection to state the name of that banker?—Mr. Roby, of Rochdale, of the firm of Fentons and Roby.”

“At what does he state them to be?—He says they are as FIFTY to one\*.”

“Do you know of any system by which an effectual check can be given to the amount to which these bills of exchange may be circulated?”

“Inasmuch as these bills of exchange all, or in great measure come to London, and are exchanged at the clearing-house without the intervention of bank notes, except in the proportion of about one-twentieth part, the check is a very inefficient one.” P. 294.

It would, no doubt, be easy for the legislature to abolish this kind of paper currency also, if it were so minded. Parliament might not only prevent credit from being given through the medium of the fittest persons, the bankers, in the most convenient form, that of notes; it might even prevent it from being given through the medium of those fittest persons in any form whatever. But could it put a stop to credit altogether? If not, is it not highly expedient that credit should

be given in a mode which admits of public-  
 ity, and in which all loss to the lenders  
 from the insolvency of the borrowers  
 may be completely obviated? You would  
 prevent a company of opulent merchants,  
 with a large capital, from issuing notes  
 which bear no interest, when you cannot  
 prevent John-a-Nokes, without any capital  
 at all, from issuing notes which bear  
 interest, to any extent to which he can  
 find persons to take them. You would  
 prevent a merchant from receiving bills  
 or notes from his banker, whose power  
 to discharge them you may render cer-  
 tain, if you please; when you cannot pre-  
 vent two merchants, on the brink of in-  
 solvency, from agreeing to draw bills  
 to any amount upon one another, and  
 with these defrauding any number of  
 dealers of their goods, under pretence of  
 a purchase.

After such testimony as the above,  
 our first position, that if local notes were  
 abolished, their place would be supplied  
 by bills of exchange, can no longer be  
 withstood. Our second, that in periods  
 of speculation the same depreciation  
 would take place by means of bills and  
 credit, which now takes place by means  
 of bills, credit, and country notes to-  
 gether, will appear upon a little consid-  
 eration equally obvious.

The banks increase their issues in  
 periods of speculation in the following  
 manner. The speculator draws a bill,  
 which he carries to be discounted in the  
 banker's notes. This he does, because  
 the notes are more convenient to him  
 than the bill; but if he can find a banker  
 to discount a bill for him, we may rely  
 upon it that he could find a dealer to  
 take the same bill in payment for goods.  
 He who has credit enough to obtain a  
 loan from a banker, has credit enough  
 to obtain goods from a dealer. When-  
 ever there is a disposition to give credit  
 too easily, which there always is in pe-  
 riods of great speculation, we may be quite  
 certain that this disposition is stronger  
 among the other classes of the commu-  
 nity, than among the bankers. Other  
 persons have other business to attend  
 to. The business of a banker consists  
 hardly in any thing else, except in  
 learning all that is to be learned con-  
 cerning the stability of those with whom  
 he has dealings. And though much  
 has been said on the subject of the  
 anxiety of a banker to get out his notes,  
 we should be surprized if it were greater

\* Mr. Burgess has since published a pamph-  
 let, in which he informs us, that Mr. Roby made  
 his statement upon an accurate examination of  
 the receipts in his own bank for years past. He  
 also states, that circulating bills compose the  
 greatest part of the currency, not only in Lan-  
 cashire, but throughout the north of England.  
 He considers Bank of England notes and  
 country bankers' notes to form, conjointly, not  
 more than a tenth of the whole paper circulation  
 of the kingdom. As a practical man, his tes-  
 timony is valuable to the important fact that  
 bills increase in a much greater proportion  
 than notes, during periods of speculation.

than the anxiety of a dealer to get out his goods.

Supposing even that it were found impossible to pay wages and perform the smaller retail purchases with bills, (though why small bills should not answer as well as small notes, we are unable to divine); it is not usually in paying wages, or in performing small purchases, that the speculator lays out the money which he borrows to carry on his speculations. And if one of the remote consequences of the speculation be the employment of additional men by the manufacturers, the absence of small notes would oppose no material obstacle to this, since the necessary quantity of gold might easily be spared from the retail transactions, by an extended use of bills in the latter; a change which, in a period of confidence, would be unattended with difficulty.

Thus, then, it appears, that in periods of speculation, the addition to the circulating medium and the depreciation of its value, are no greater with a local bank paper than without it\*.

\* It may possibly be contended, that an addition to the number of bank notes depreciates the currency somewhat more than an addition of equal amount to that part of the circulating medium which consists of bills; because paper which bears interest, does not in general pass so rapidly from hand to hand, as paper which is wholly unproductive in the hands of the owner. This is in some measure true. When a bill of exchange comes into the hands of a person not in business, or whose business at that time happens to be slack, he generally keeps it till it becomes due, having no particular motive to make purchases with it, and being well satisfied that so much of his capital should be yielding interest without trouble to himself. But the bills drawn for the purposes of speculation are drawn in order to make purchases; and pass into the hands of the dealers in those articles which are the objects of speculation. With them, of course, business is very brisk, and they are very active in extending it. Far from keeping a bill in their hands for the sake of the interest at such a period, they are more likely, besides paying away the bills they receive, to draw additional bills of their own, for the purpose of increasing their available capital.

We have the important testimony of Mr. Tooke to the fact, that "a great briskness in the general circulation, a rapidity in the interchange between goods and money, or credit," is "an invariable attendant on speculative periods."—*Tooke on High and Low Prices*, 2nd. edit. p. 73.

But even if it were true, that an addition to that part of the currency which consists of bills, produced a less depreciation than is produced by an equal addition to that part of it which consists of notes, there is a counterbalancing circumstance. The amount of

Metallic money, therefore, has no advantage over paper in periods of speculation. But paper money has an immense advantage over metallic in the revulsion which follows.

During a commercial crisis, credit almost entirely ceases. None but the very best bills, and of the shortest dates, will pass current in the market; and for all other payments, ready-money must be provided. Those who have it, are unwilling to let it out of their hands; knowing that nobody who has demands upon them, will receive payment in any other medium. They therefore postpone all ready-money purchases. Thus, at the very moment when money and nothing else will be received in purchases, scarcely any money is offered; its purchasing power consequently is prodigiously increased, prices fall ruinously low, and insolvencies are multiplied a hundred-fold beyond what the mere destruction of the paper of the original insolvents could have produced. Now then, if a supply of paper, of undoubted security, can be poured into the market, sufficient to compensate the undue contraction of the currency, all this unnecessary evil is obviated. But if not, it must wait the tardy process of importing bullion from abroad: which, after all, may perhaps be hoarded as fast as it comes in.

If the distress of last winter was what it was, notwithstanding the issue of several additional millions of Bank of England notes; what might it not have been if the enormous contraction, natural at such a crisis, had been suffered to continue?

We have now, we hope, fully answered the second great proposition of our antagonists.

3. *Rate of Interest.*—The third proposition is, That when the paper currency is suddenly increased, a fall takes place in the rate of interest, which, by diminishing the incomes of the owners of small capitals, drives them to

bills in circulation may be more easily multiplied than the amount of notes. Every one who passes a bill affixes his own indorsement to it. The security of every bill thus becomes greater than that of most of the notes, and it consequently will be accepted with less difficulty.

engage in hazardous speculations; and that this actually happened during the last three years.

The first position which we think it necessary to lay down, is one which, we presume, will be called *theoretical*; not because it is a *theory*, for that is a character common to all general principles, but because it differs from the theory of those who arrogate to themselves the exclusive appellation of *practical men*. The practical men generally imagine, that the rate of interest depends upon the quantity of the circulating medium. Our proposition is, that it depends upon no such thing; but purely upon the competition between the lenders and the borrowers; and can be affected by no circumstance which does not influence either the amount applied for by borrowers, or the amount offered by lenders.

This surely is almost as obvious of itself, as any illustration can make it. If, in one night, every piece of money in the country, of whatever denomination, were doubled, whereby all prices would be doubled, and the purchasing power of money reduced one-half; can any person suppose that the rate of interest would be lowered? True it is, that all who lent money would have twice as much to lend; but as it would now require twice as much to perform any purchase, all who borrowed money would now find it necessary to borrow twice as much. The lenders and the borrowers would bear the same proportion to each other, and the rate of interest would remain unchanged.

This error, which consists in supposing, that the quantity of the currency regulates the rate of interest, and which is one of the most common of the many errors constantly committed by mere men of business, when they wuddle with general reasoning, arises from that frequent source of incorrect inference, ambiguous language. The word *money* is used in two significations. In its common signification, money means money; currency; the circulating medium: the quantity of money means the quantity of currency; the value of money means its purchasing power. In the language of commerce, on the contrary, money means money lent, or rather money offered to be lent. The market for loans is called the money-market; by the value of money,

is meant the rate of interest: great facility in obtaining loans is called plenty of money; great difficulty in obtaining them, is called scarcity of money.

This *equivoque* would, it might be thought, be too obvious a one, to impose even upon the most ignorant; nor do we believe that it would impose upon any body except the *practical men*; who, because they know better than other people a sort of facts which are not to the purpose, think themselves entitled to remain in perfect ignorance of all those which are. No other class of persons could have imagined, because *currency* and *loans* happened to be called by the same name, that an abundance of the one imported an abundance of the other. The practical men, however, imagine that it does.

But there is another and a more intelligent class of reasoners, who, allowing that it is an increase of loans, and not an increase of the currency, which operates to depress the rate of interest, affirm, however, that from the manner in which our paper currency is issued, exclusively through the medium of loans, an increase of the paper currency almost necessarily imports an increase of loans. It is upon this ground, that they ascribe to the paper currency, the speculations of the last three years. Before the speculations began, there had been, they contend, a greatly increased issue of paper, the whole of it in the way of discounts or other advances, by the country banks. This lowered the rate of interest, and by reducing the incomes of those who lived by the interest of their capital, drove them into all sorts of hazardous speculations. An increase of issues by the Bank of England afterwards took place, and still further heightened the evil.

This opinion, though less absurd in principle than the foregoing, imports a misapprehension of the actual facts.

Allowing that an increase of lenders tends to lower the rate of interest, it will not certainly be contended that every increase of lenders has this effect. It is only when an increase of lenders takes place, *unaccompanied by a corresponding increase of borrowers*, that it produces a fall in the rate of interest. If an addition be made to the loans, coincidently with an equal addition to the demand for them,—much more, if the former addition is called forth by, and is

the consequence of, the latter,—we might more reasonably expect that this variation in the state of the money-market, should be attended by a rise in the rate of interest, than that it should be productive of a fall. And such, as we shall prove by documentary evidence, was the character of that increase of loans, which took place during the last three years. It therefore was not, we may infallibly conclude, the cause of any depression of the rate of interest.

The increased issues were made, partly by the country banks, and partly by the Bank of England.

It is allowed on all hands, by what circumstance the increased issues of the country banks were occasioned. They were occasioned by the rise which had been gradually taking place since 1822, in the prices of all descriptions of agricultural produce. Now, the only manner in which this could cause an increase of issues, was by causing an increase of applications for them. In what manner it does this has been explained in a former part of this essay. The increase of lending, therefore, was called forth by a previous increase of the desire to borrow. After the speculations began, a further increase of issues was produced, by a further increase of applications. The additional loans, therefore, did not come into competition with any part of the capital previously lent: and the increased issues of the country banks may be dismissed, as having had no tendency, direct or indirect, to depress the rate of interest.

The increased issues of the Bank of England stand upon somewhat a different ground. In the case of this establishment, the extension of its loans was its own spontaneous act, for the purpose of carrying off the superfluous quantity of specie in its coffers. And had its additional loans been made in the ordinary mode, (the discount of mercantile bills,) its tendency to lower, for a short time, the rate of interest, would have been out of dispute. The new loans were, however, made to a new borrower—the Government. They were made, in the purchase of the Dead Weight, as it is called; that is, the military and naval pension annuities.

Mr. Vansittart, when Chancellor of the Exchequer, finding that the military and naval pensions pressed heavier upon our finances than appeared to him to be

pleasant or convenient, bethought himself of a plan for taking a part of the load off the shoulders of the present generation, and laying it upon posterity. This was to be effected by prevailing upon somebody to take upon himself the great, but constantly decreasing burthen of these pensions, upon condition of receiving, in return, from the public, a fixed annuity for 45 years. This was obviously equivalent to raising an annual loan to defray so much of the annual expense of the pensions as exceeded the fixed annuity; the loan to be repaid gradually, when, by the decease of a part of the pensioners, the annuity should in its turn come to exceed the pensions. To raise a loan, keeping up at the same time the mockery of a sinking fund, was exactly of a piece with that system of trickery and juggle which was the grand characteristic of Mr. Vansittart's financial career. But with this, or any other of the absurdities, with which this extraordinary measure was chargeable, we have at present nothing to do. The point essential to our argument is, that the Bank undertook the payment of a certain portion of the pensions, on condition of receiving from the public a fixed annuity of 558,740*l.* From the value of the transaction, its advances, in the first years, of course, greatly exceeded this annuity, and could not be made without either diminishing its accommodation to individuals, or increasing the amount of its issues. Its accommodation to individuals had already been greatly reduced, by its refusal to discount, except at a rate of interest exceeding the market rate. But still the reduction had not been sufficient to admit of its making the new advances to Government, without an increase of its issues; which accordingly took place.

So much for the facts. Now for the application. The Bank extended its loans. But to the same extent to which it extended its loans, a new borrower appeared, in the person of Government. The new loans displaced no capital which was already invested, nor deprived any of its expected, or customary, investment. If the advances had been made by private capitalists, from funds which they had, previously, been in the habit of lending to individuals, who does not perceive that there would have been a considerable rise in the rate of interest? The effect of the extension of the Bank

issues, was to prevent this rise. It produced no fall. From the nature of the case, it could not produce any.

The Bank does not make returns of the amount of its discounts, and other loans to individuals; and parliament was in too great a hurry to legislate on the subject, to think of calling for much information regarding it. They called, however, for returns of the amount of notes in circulation for some years back, on the fifteenth days of February, May, August, and November, in each year: periods chosen as being the remotest possible from the payment of the quarterly dividends, which always occasions a great temporary fluctuation in the

amount of the currency; and therefore indicating, more nearly than any other periods which could be chosen, the average issues for the quarter. The annexed Table exhibits these quarterly returns for the three years, 1823, 1824, and 1825, compared with the average amount in circulation in 1822, computed from the same returns; and contrasted with the advances which the Bank had made, up to the same periods, on the dead weight. It will thence appear, that, with one exception, at every one of the twelve quarterly periods the advances on the dead weight exceeded, often greatly exceeded, the increase of the Bank issues.

Average amount of notes in circulation during the year 1822, taken from the quarterly returns ..... } £18,042,925.

| Year.    | Notes in Circulation. | Excess above average of 1822. | Amount of advances on the Dead Weight. | Greater or less than the increase of issues. |
|----------|-----------------------|-------------------------------|----------------------------------------|----------------------------------------------|
| 1823.    |                       |                               |                                        |                                              |
| Feb. 15. | £17,802,610           | none                          | none                                   | } Greater.                                   |
| May 15.  | 18,501,370            | £ 458,445                     | £ 885,719                              |                                              |
| Aug. 15. | 19,892,810            | 1,849,885                     | 2,110,719                              |                                              |
| Nov. 15. | 20,353,130            | 2,310,205                     | 1,885,719                              | } Less.                                      |
| 1824.    |                       |                               |                                        |                                              |
| Feb. 15. | 20,357,160            | 2,314,235                     | 3,060,719                              |                                              |
| May 15.  | 19,961,900            | 1,918,975                     | 2,895,719                              | } Greater.                                   |
| Aug. 15. | 20,960,530            | 2,917,605                     | 4,010,719                              |                                              |
| Nov. 15. | 21,184,420            | 3,141,495                     | 3,745,719                              |                                              |
| 1825.    |                       |                               |                                        |                                              |
| Feb. 15. | 21,301,930            | 3,259,005                     | 4,880,719                              | } Greater.                                   |
| May 15.  | 20,046,070            | 2,003,145                     | 4,615,719                              |                                              |
| Aug. 15. | 19,676,010            | 1,633,085                     | 5,746,094                              |                                              |
| Nov. 15. | 17,980,620            | none                          | 5,453,224                              |                                              |

At all these periods, except one, the reader will perceive, that the Bank had increased its loans to Government, more than it had increased the totality of its issues; its loans to individuals, therefore, by which alone the rate of interest (as we have shewn) could possibly have been affected, were diminished; and the effect, therefore, which the operations of the Bank were producing upon the money market at all these periods, must have been to keep up the rate of interest, instead of depressing it. The one period, which we mentioned as an exception, was that of November, 1823; at which the increase of issues did exceed the advances to Government by rather more than 400,000l. How far so trifling a variation as this, which is not greater than is happening, as the monthly returns shew, almost every month, and which was almost immediately withdrawn, is entitled to be

considered as the cause of the fall in the rate of interest which took place, we leave the reader to judge\*.

But what, then, it will be asked, was

\* Much has been said on the subject of the peculiar evils which are supposed to have arisen from the loans (to the extent of 1,400,000l.) which the Bank came to the resolution of making upon mortgage. That such loans were utterly inconsistent with all sound principles of banking, on account of the virtual inconvertibility of the security, we admit: but these loans could not affect the money market in a different manner from any other loans. The table in the text has shewn, that when the Bank made these advances on mortgage, its loans to individuals were less, discounts and mortgage taken together, than they were when it made its loans solely by way of discount: notwithstanding the mortgages, therefore, its operation upon the rate of interest, must have been, not to produce the fall, but to check it. In point of fact, the Bank resorted to the measure of lending on mortgage, only because it could get no bills to discount, its rate of discount being higher than the market-rate.

the cause of the great fall, which took place in the rate of interest, in 1823 and 1824?

We protest against the supposition, that we are under any sort of obligation, because we negative an alleged cause, to assign the real one. We will, however, make the attempt; premising that we do not pretend to do more than conjecture; nor are we by any means certain that in a case of this sort, any thing more than a conjecture can be made.

The rate of interest, like the prices of commodities, though it is subject to casual variations, has nevertheless a point to which it converges; and this point is regulated by the rate of profit upon mercantile capital. The rate of interest, on the average of a considerable number of years, always bears some proportion to the rate of profit\*. If therefore, we had the means of ascertaining what rate of interest the ordinary rate of profit would warrant, we should have the means of discriminating between these fluctuations in the rate of interest which are casual and temporary, and those which are permanent.

Now, to a criterion of this sort, though we cannot obtain it exactly, we may distantly approximate. During the ten years of peace which followed the American war, and during which the rate of interest seems to have been tolerably steady, the average price of three per cent consols was about 76†; and the

rate of interest on the best security, measured by this test, would appear to be somewhat under four per cent. This, therefore, may be considered, with some plausibility, as the rate of interest which was at that time warranted by the average rate of profit upon capital. After this period ensued a war of 30 years. During war the rate of interest is always higher, relatively to the rate of profit, than during peace: because the immense loans which are then called for, with a view to unproductive expenditure, and not to profitable employment, render it necessary that a greater proportion of the holders of capital should be induced to lend it, in preference to engaging it in business: which inducement can only be held out by means of a rise in the rate of interest. In the meantime, the great increase of our population, combined with the Corn Laws, which have only come into operation since 1815, has raised the price of the necessaries of life greatly above the average of the years preceding the war. This has raised nominal wages, and by increasing that part of the cost of production of all commodities which consists of the subsistence of the labourer, has lowered the general profits of stock. Adverting, therefore, to the greatly increased prices of necessaries in the last ten years, as compared with the ten years preceding 1793, we shall not perhaps be far from the truth in conjecturing, that if 4 per cent. was a rate of interest justified by the rate of profit in 1788,  $3\frac{1}{2}$  per cent. is as much as is justified now.

This would show 85 or 86 as the natural and reasonable price of three per cent consols at the present time, and probably for some years to come. To this price, accordingly, the three per cents have always gravitated. From the close of the war the funds gradually rose, until their rise was checked by the commercial distress of 1819. Commercial distress, by producing a great immediate demand for ready-money, always lowers greatly the price of, in other words, increases the interest on, all securities which are immediately convertible. The three per cents fell in 1819 to 60½. But they soon resumed their tendency upward, and on the first of November, 1822, they stood at 82½. For a few months afterwards, they were slightly depressed, by anticipations that this country might possibly become

\* This dependence of the rate of interest upon the rate of profit, gives the measure of the extent to which an increase of loans, even when uncalled for by any increase of borrowers, can depress the rate of interest. Of the class of lenders there are always some, who at the existing rate of interest would rather lend their capital than embark in business themselves, but who, on the slightest reduction, would cease to lend, and withdraw their funds to another investment. Capital is thus withdrawn from the money-market, to an amount equal to that of the additional loans, and then things are as they were before. This answers the general argument against our paper currency, founded on its supposed tendency to cause fluctuations in the rate of interest. In the text we have contented ourselves with analyzing the particular case on which the supporters of that argument rely.

† We exclude the year 1793, which, if taken into the account, would render the average of the whole period far more favourable to our conjecture than it now appears. But we are aware that the very high price of the public securities in that year, was owing to peculiar causes not connected with the general rate of profits on capital.

involved in the war which was then commencing between France and Spain. When these anticipations ceased, the rise of the funds recommenced, and on the second of December, 1823, they were at  $84\frac{1}{8}$ , not far from their present price (in December, 1826).

Thus far the fall of the rate of interest is easily and naturally accounted for, by supposing it to be a reasonable and proper fall, with reference to the rate of profit at the time. The subsequent rise of the funds from  $84\frac{1}{8}$  to  $96\frac{1}{8}$  in about five months, cannot be thus accounted for. It would be absurd to suppose that in so short a time a fall took place in the rate of profit sufficient to warrant so great a fall in the rate of interest. But the truth is that no fall took place in the general rate of interest, corresponding to this rise of the funds. We are assured by persons possessed of the most authentic information, that the rate of discount on the best bills never fell lower, during the last four years, than  $3\frac{1}{2}$  per cent. To this level it had already fallen in July, 1823, long before that sudden rise in the public securities, of which we spoke. We have little doubt that this rise was merely the effect of speculations on the Stock Exchange. It occurred at a period when speculations were rife, and when, the funds having risen gradually with little interruption for three years, the speculators were very likely to calculate upon a further rise. At all events, from whatever cause the rise may have begun, it was sure, when it did begin, to set the speculators in motion, and to produce that ulterior rise from speculative purchases, to which the funds are liable in common with all other articles which are bought and sold.

We have now disposed of the three great arguments against a paper currency in general: viz. first, that it is liable to over-issue; secondly, that it affords facilities to speculation, when excited by other causes; lastly, that the fluctuations in its amount, produce fluctuations in the rate of interest, and that, when a fall of interest is produced by this cause, speculation is the consequence.

If the foregoing deductions are as conclusive as they appear to us, it has been established that these three objections either are not applicable to a paper cur-

rency at all, or not in a greater degree than to a metallic currency.

The expediency, therefore, of the suppression of the small notes, in so far as it depended upon any of these reasons for its support, may be pronounced to have been disproved.

Of objections applicable to the small notes, but not applicable to a paper currency at large, two only have been alleged. The first is, that the holders of small notes are the persons who suffer most from the insolvency of the issuers: The second is, that the small notes are the great cause of panics.

The first of these objections would be obviated, if the insolvency of banks of circulation were rendered, as it might be rendered, virtually impossible. The second appears to us to be unfounded.

Under a system of banking so wretchedly constituted as ours, where that general apprehension, which is called a panic, is often no more than a very justifiable alarm—it may be that the alarm (although it does not arise earliest) continues longest, and is most difficult to remove, among the holders of the small notes. And under such a system it may be said, with some plausibility, that the small notes are a cause of panics. Under a secure banking system, on the contrary, it is not the small notes, but the absence of small notes, which is apt to be a cause of panics.

In Scotland, where there is no reason for a panic, (only two banks of circulation, we believe, having there become insolvent in the last hundred years), it is in evidence before the committees that the people prefer notes to gold, because they feel themselves incapable of discriminating between real and counterfeit coin. This will always be the case, where the currency, with the exception of the subsidiary coins, is wholly paper, and where no insolvencies occur to shake the public confidence in the latter. If gold circulated in Scotland along with notes, the probability of a panic, under a banking system so perfectly secure, would even then not be considerable; but it is difficult to believe that it would not be greater than at present.

While ministers and parliament were wholly taken up by the vain attempt to remove the causes of mercantile revolutions, they neglected to apply many of those palliatives, which legislative wis-

com would have suggested, to mitigate the destructiveness of those revulsions, when they occur.

Against one of the most distressing features in the late crisis, the failure of the country banks, they did indeed provide a partial remedy, by permitting the establishment of banks with an unlimited number of partners, in any part of the kingdom, beyond a circle of 65 miles round London. The Bank of England would not consent to any greater sacrifice of its exclusive privileges, except upon condition of a further prolongation of its charter: to which condition, much to their credit, ministers refused to accede; and England must, therefore, wait till the year 1833, when the Bank charter will expire, for the establishment of banks with more than six partners in and near London, or of banks with limitation of the responsibility of any of the partners, in any part of the kingdom. For what has been done, however, by ministers, to render banking partnerships more secure, we are willing to give them the due praise; and, in our opinion, much more has been done than many of the speakers in parliament were disposed to allow.

It was argued, by Mr. Baring and others, that unless the measure extended to the establishment of banks with limited responsibility, either upon the principle of a *commandite* or of a joint stock company, it would be nugatory; since very few banks had hitherto availed themselves even of the full number of partners allowed by law; and if even six persons had so rarely been willing to risk their whole fortunes by embarking in a bank without limitation of responsibility, it was, they argued, extremely improbable, that a still greater number of persons should do so.

The readers of our former volume are aware that we entertain an opinion highly favourable to such an alteration in the law as shall permit *commandite* partnerships, not only for banking purposes, but for all others. Yet, we are far from going along with Mr. Baring in the opinion, that because this has not been done, nothing has been done. The difference, either in stability or in credit, between a bank with five and a bank with six partners, is a trifle: and the sixth place, being the last, will generally be kept open until some person, with capital and credit sufficient to be of

material service, may offer himself to fill it. But the difference both in stability and in credit between a partnership of six and a partnership of sixty, is *ceteris paribus* very great; a bank, therefore, which has no motive to increase itself to six, might have abundant motive to increase itself to sixty partners, which it could the more readily do, as the risk to each of the sixty would only be one-tenth of what it now is to each of the six. The truth is, that associations of from six to twenty partners are by many degrees more unsafe than any other kind of partnerships. The majority of the partners, though their whole fortune is at stake, cannot personally superintend the management, and they are not sufficiently numerous to appoint a committee for the express purpose of watching over their interests. When the shareholders are more numerous, they appoint a Board of Directors to superintend and control the managing partners or officers; and that superintendence, which cannot be exercised by the partners individually, is regularly exercised by those of their number in whom they most confide.

It is difficult to conceive how Mr. Baring could assert, that persons would not be found to enter as sleeping partners into banking companies without limitation of responsibility; when he could not be ignorant of the great number of mining and other associations which exist in London without any such limitation; and when, (to say nothing of the newly-established provincial banks in Ireland,) it is proved by the returns made to parliament, that six of the Scotch banks\*, without any limitation of responsibility, consist of 112, 147, 202, 446, 521, and 1238 partners respectively; and that there are five other Scotch unchartered banks, in each of which the number of partners exceeds sixty—while, of the twenty-nine unchartered banks, there are only five in which the partners amount to any number intermediate between eight and sixty-one; a fact strongly corroborative of our remark, that such partnerships hold out less advantages than any others.

Nor is there more weight in another

\* The Arbroath Banking Company, the Perth Banking Company, the Dundee Commercial Bank, the Aberdeen Town and Country Bank, the Commercial Banking Company of Scotland, and the National Bank of Scotland.

argument which has been urged by some, to prove the unimportance of the late alteration in the law; namely, that a considerable number of the Scotch banks consist only of a small number of partners. It has never been asserted that the existence even of chartered banking companies, was incompatible with the existence of common banking partnerships. But it is incompatible with the existence of banking partnerships whose credit is not equal to that of a banking company; and this is surely as perfect a security as is necessary. Accordingly, the banks with few partners have in Scotland been found practically as secure as those with many.

The measure of ministers, therefore, was not only unobjectionable in principle, but will prove, we doubt not, useful in practice. Still, it was not the only security, which it would have been practicable and useful to take against the insolvency of bankers. And, such as it is, it will not, probably, come into full operation for some time. There is another and a still more effectual check, which might have been brought into operation immediately. It might have been rendered imperative upon the country banks to make returns, at stated periods, of the whole amount of their notes actually in circulation, together with the property which, after satisfying all other demands, the concern possessed, as the means of meeting those notes. These returns should, like the returns for the purpose of the income tax, be liable to be verified on oath, if required; and should include all the assets of the concern, exclusively of the private fortunes of the partners. No banker, to whose credit the publication of these statements would be favourable, could feel any disinclination to furnish them; and while they would render it absolutely impossible for a bank to issue more notes than it possessed the means of paying, they would not be liable to the same objections as the regulation which has been suggested, requiring all banks of circulation to make deposits of stock, a plan which, to say nothing of several other possible inconveniences, would probably cramp exceedingly the power of the banks to afford accommodation to the public. The same regulation would meet the objection which we have sometimes heard against a currency consisting of small notes, that the influence of the

country bankers is such as to render them virtually inconvertible. Under the present banking system this argument may have some weight. We can readily conceive that it may be in the power of a country banker to pass his notes among the poorer classes, although his credit is not sufficient to give them general circulation. But the plan which we have suggested would put an end forever to the circulation of country notes of inferior quality. The quantity can never be unduly increased by the mere influence of the country bankers. For there is always *somebody* in every district who is beyond the sphere of that influence; and as soon as the amount of the circulation has been increased beyond the due extent, it is the interest of this *somebody* to buy up the notes and present them to the issuers for payment.

The Bank of England likewise should be required to make periodical and frequent returns of its issues; distinguishing according as the notes were issued in discounts, in purchases of exchequer bills, advances to Government, purchases of bullion, and so forth: not to obviate any danger of the insolvency of that establishment, but in order that any alteration in the amount either of its issues or of its loans, which could affect either the money market, or the value of the currency, might be known at the very earliest period possible. Such returns would not only remedy all the real defects of our currency, but, even if the defects were real, which we have shown to be imaginary, even to these they would provide an effectual remedy.

Another measure, which parliament did not think proper to adopt, but which, had it been adopted, would have done more to relieve the present, and mitigate future distress, than any other measure that can be named, is the repeal of the Usury Laws.

One of the chief peculiarities of a period of commercial distress is, that every body wishes to borrow, while nobody is willing to lend. From a fall of prices, or the failure of some one who is indebted to him, a merchant is disappointed of a sum which he expected to receive, and which was his only immediate means of meeting an engagement falling due the same day. Failure to pay a bill when it becomes due, is an act of insolvency; and a merchant will raise

money at any sacrifice to avoid it. When many persons are placed simultaneously in this situation, it may be supposed for what an extraordinary amount, beyond the usual quantity of loans, a demand is produced. But the same cause which produces this desire to borrow, produces at the same time a disinclination to lend: not only by reason of the little confidence which at such a period is likely to be felt in the solvency of the borrower; but because the fall in the public securities, and in the prices of goods, occasioned by the same attempts to raise money immediately, enables him who has funds at his command, to invest them at a profit greatly exceeding the legal rate of interest. Who would lend to a merchant at five per cent, at the risk of losing all by his insolvency, when by buying into the three per cents at 75, he can obtain immediately four per cent upon his money; and by selling out a year afterwards, when they have risen to 83, realize a profit of about ten per cent more, independently of the dividends accruing in the intermediate period, amounting in all to a gain of fourteen per cent in one year? The same persons might perhaps be willing, if they were permitted, for the sake of the immediate gain, to discount at short dates, at the rate of seven or eight per cent. Thus, by not being permitted to borrow money for a few weeks, at two or three per cent above the legal rate, many merchants have no doubt been ruined; while a far greater number have possessed themselves of the means of continuing their payments by the most enormous sacrifices in other ways. For here the absurdity of the usury laws shines out in the most glaring colours. The laws which prevent money from being raised by borrowing, cannot prevent it from being raised by forced sales of stock, or forced sales of goods. The same stagnation which renders it so difficult to borrow money, renders it still more difficult to dispose of goods, except at ruinously low prices. Mr. Tooke\*, in his pamphlet on the currency, states, that to his knowledge, during the late crisis, extensive sales were made of stock, at a loss of twenty or thirty per cent; and of goods for immediate money, at a still greater sacrifice. Mr. John Smith† “knew an instance

“in which, for a very large sum, no less than from 74 to 76 per cent had been paid. This, of course, had been done by a bargain in selling out stock for money.” And Sir Henry Parnell\* stated, that “a banker had told him that instances had come to his knowledge, “in which,” by forced sales of goods, “a loss of 90 per cent had been incurred.”

The opportunity was lost of ridding the country of the nuisance of these laws, which, nugatory in periods of prosperity, exist exclusively to the effect of aggravating the pressure of commercial distress.

The list of palliatives which might have been adopted, is far too long for enumeration. We must, however, add one more, which we hold to be of considerable importance. The notes of the country banks ought to have been made payable in Bank of England notes only, and not in gold. It is evident that so long as the Bank of England is solvent, the security of its notes is equal to that of gold. By rendering them a legal tender in exchange for country notes, not only would the nation be spared the expence of keeping a reserve of gold in every country bank, but the evils of a panic would be greatly mitigated. It is well known that the great cause of the failure of so many London bankers in December 1826, was the immense drain upon them for specie to meet the demands of their country correspondents. The same demands produced that drain upon the bank, which so very nearly produced a second suspension of its payments.

To the above catalogue of remedies omitted, may be further added the repeal of the Corn Laws; which, as we have shown in a former place, are the cause of the chief fluctuations to which our currency is liable, and which, moreover, by lowering the rate of ordinary mercantile profit, really produce that tendency to hazardous speculations which is so erroneously, though so commonly, imputed to the system of our currency.

If the views which have been promulgated in the preceding pages be correct, it must appear that parliament, in its attempts to legislate for the currency, and for the commercial crisis, has erred most

\* P. 62.

† *Ante*, p. 320.

\* *Ante*, p. 236.

widely, both in what it has done, and in what it has omitted to do.

These errors did not take place without a cause; and the cause, which led to such effects, must needs be one, which it is of no small moment to us to investigate.

Interest, in this case, is chargeable with no part of the blame. Neither Parliament, nor those who make the Parliament, had any interest in the question, other than the general interest of the nation: and the speakers from all sides of the two Houses demonstrated generally a laudable freedom from party feelings and prejudices. Yet, though every person obviously applied his mind to the subject with the most sincere desire of being right, it not only happened, in our opinion, that the great majority came to a conclusion which is wrong, but all who are even moderately conversant with the subject must allow, that but a small share of ability was displayed by either side, even in the statement of its case. Nobody seemed to have made the subject a matter of study. Nobody seemed to have made even an attempt at examining it in all its bearings. They had come to the consideration of the facts of a very complicated case, unprepared by a previous acquaintance with those general principles, which would have taught them what were the facts, among so great a number, which it was necessary to attend to. They remained almost universally in ignorance of the material facts, for want of knowing what facts *were* material; and attending only to the obvious appearances, jumped from one seeming coincidence, to a crude generalization. Even the most acute, for want of a clue to guide them, could do no more than can be done by mere sagacity, unassisted by knowledge; which is, to form a strong conception of some one or two of the material circumstances, and to draw, from these one or two circumstances, what would have been a just inference if there had been no *other* circumstances to be taken into the account, but in which all the other circumstances were overlooked. The crudeness of their conceptions was strikingly demonstrated by the inability of any of them to give any thing like a connected statement even of his own case. With the exception of the Marquis of Lansdowne\* on the one side, and Major Maberly on the other, not a man could state the grounds

of his opinion in a manner which would be deemed creditable by any well-instructed person who agreed with him. And even the Marquis of Lansdowne only professed to state the argument as he found it in Mr. Tooke's pamphlet. It is true that he could not have taken it from a better source: it is true, moreover, that he seems to have understood the pamphlet, and therefore, although in our opinion misled, he was misled by arguments by which it is no discredit to a man of sense to have been led astray. There were few of the speakers on this question, Whigs or Tories, in whose favour so much as this can be said.

This universal incapacity is not accidental, nor is it confined to this question. It may be observed on all questions requiring any depth of thought, or accuracy of knowledge; and it is only more conspicuous on a subject like the present, because it is not quite so easy to make words pass for ideas on such a topic, as on a question of government, judicature, or law. Nor will this incapacity appear wonderful, when we reflect, that the same cause which disables most of our public men from coming to the right conclusion on one subject, disables them equally on all—they have no general principles to guide them.

As there are quack physicians, and scientific physicians, so there are quack politicians, and scientific politicians. The characteristics of the quack are very seldom accurately conceived; and the word generally expresses little more than a vague and unanalyzed feeling of contempt. But the distinction between the man of science and the quack, is broad and obvious. The man of science is he who knows and applies the general principles, the theory, of his art. The quack, or empiric, is he who, ignorant of principles, generalizes upon the few particular instances which his own narrow experience has presented to him. Now, the general principles of the physician are the general laws, according to which it has been observed, or inferred, that the phenomena of the human body regulate themselves. The general principles of the statesman are, in like manner, the general laws, according to which it is observed, or inferred, that the phenomena of human society regulate themselves. By the diligent study of these laws, the philosophic statesman or physician has learned, what *causes*, in the field

\* *Ante*, p. 175.

of his inquiries, are followed by what *effects*. By this knowledge, he is taught to look for the effect, only when he has perceived the cause: while the empiric, on the contrary, who is ignorant of the cause, expects the effect, whenever he has observed that, once or twice, in circumstances not obviously dissimilar, the same event, or something like it, has occurred.

The world has produced many scientific physicians, but few, very few scientific statesmen: nor is there much in the education or pursuits of our practical politicians, which warrants the expectation that many such will arise in their ranks for a long time to come.

In the first place, every scientific statesman must, in the present state of the world, be self-taught. In any established system of education he will meet with few helps, and many obstructions. He to whose skill the care of the human body is confided, finds every where some provision made for teaching him, in the best manner which the state of science in the age and country will allow, the causes which determine the good or ill condition of the human body. But he who is destined to direct the government of a nation, finds nowhere any adequate provision for teaching him the causes which determine the good or ill condition of the *political* body. In few countries do the laws of human thought, and human action, the principles of legislation, government, and political economy, form any part of the established course of education. In the great public seminaries for the education of the higher ranks of our countrymen in particular, not only are these branches of knowledge not taught, but every thing that is practicable is done to keep the mind of the student from turning towards them; partly by direct discouragement, partly by holding out rewards and honours exclusively to pursuits of a character diametrically opposite, and the more trifling and unprofitable the better; thus drawing off, by the appearance of intellectual exercise, those active minds, which are ambitious of higher distinctions than that of being victor in a rowing match, or in a horse race.

If the education of our statesmen and legislators does so little to fit them for their business, their subsequent occupations do still less.

A part, after they leave the school or the university, enter into the subordinate

departments of the public offices, and serve their apprenticeship to the highest functions of government by discharging the lowest. If these have not acquired a taste for the study of the general principles of political philosophy, before they enter upon this career, they are little likely to acquire it amid the official drudgery in which they are from that time immersed. It is not in the midst of such occupations as these, that the mind learns to contemplate, on an extended scale, the operation of the causes of national prosperity and decline. Facts, of a certain description, they may have opportunities of observing; statistical facts, which it is necessary that the statesman should know, as it is necessary that the physician should know the constitution of his patient, but which he can learn as well, or better, from the testimony of others, as from personal observation. But it would be as reasonable to expect that a bricklayer's labourer, by piling up bricks, should learn the principles of architecture, as that a clerk in an office should learn, in the exercise of his calling, the principles of good government. He who learns nothing but official details, knows nothing but official details: and if he would know any thing else, he must seek his knowledge elsewhere.

The next class from whom our legislators are drawn, is the mercantile and manufacturing class. After a life spent in the inspection of balance sheets, and prices current, they retire from 'Change, and frequent St. Stephen's, imagining themselves capable of managing the state, because they have succeeded in managing the counting-house. The circumstance which is most characteristic of this class, is the persuasion which they have universally imbibed, that on all subjects which concern the wealth or commerce of a nation, it belongs to them to decide, and to the rest of the world to obey. These pretensions they uphold by styling themselves practical men, and warning off the ground, with no very mild denunciations, all persons who, under any other title, venture to encroach upon it. The idea which, we presume, they wish to convey when they call themselves practical men, is, that as men of business they possess a practical knowledge of many facts, not equally well known to others, which bear upon the particular question under discussion. Even if this were true, it would not entitle their opinion to any particular weight; be-

cause the knowledge of facts does not necessarily impart any peculiar qualifications for drawing the right inferences from these facts; and besides, if they know facts not known to other people, let them state those facts; but let them not complain because their *inferences* from facts are not taken for facts, and received upon their authority. The assertion, however, that what are called practical men, possess any peculiar acquaintance even with the facts, on which the decision of great public questions usually turns, is devoid of truth. A merchant, as such, is not *necessarily* acquainted with any facts, except those which determine him to buy and sell: nor even here is his knowledge necessarily very profound. Those who have been behind the scenes know well, what an affair of mere routine mercantile business usually is. To produce, purchase, or import, every year, about the same quantity which was produced, purchased, or imported, the year before, increasing or diminishing the quantity a little, as the market appears to be looking up or down,—constitutes, pretty nearly, the sum total of the art of commerce, as it is commonly practised. What the chancellor Oxenstiern said of the government of the world, may be said with almost equal correctness, of its trade, *Quam parvâ sapientiâ regitur!* The moment these men of practice quit the beaten track, strike out a path for themselves, and launch into the field of commercial speculation, all becomes mere guess work: the sort of experience which they have acquired is not of a nature to make them acquainted with the *remote* causes of the events which they hear and see; and their ignorance of these renders them mere gamblers; incapable of foresight, incapable of calculation; staking their fortunes upon the chances of the market, precisely as men of another description stake theirs upon the chances of the card-table.

It is not to be denied that a merchant has peculiar *opportunities*, if he knows how to employ them, of knowing *some* of the facts which bear upon many great public questions. But these very opportunities of knowing some of the facts, are apt to divert his attention from the remainder; and by knowing half the facts, being ignorant of the other half, he is still more likely to come to the wrong conclusion, than he who is ignorant of the whole. He may, in general, be trusted to,

for judging, with tolerable correctness, of the effect which any measure will have upon his own immediate interest. That ignorance of remote causes, of which we spoke, disables him, in the majority of cases, from judging correctly of the effect of the measure, upon even his own *ultimate* interest: and of its effect upon the *public* interest, he is usually a worse judge than other people, because his attention is wholly fixed upon a different part of the subject. We might illustrate this observation by numerous specimens of the part which has been taken by the practical men on almost every great commercial question for the last twenty years. As might be expected from the extremely narrow range of their experience, they are in the habit of giving utterance to more absurd theories than any other class of human beings, and are notoriously the last persons who can be taught how to use their own eyes, or to comprehend the most obvious signs of the most familiar phenomena. At the time of the Bullion Report, they to a man maintained, that a currency could never be depreciated, so long as it was issued only in discounts at 5 per cent, upon bills of short date, and undoubted security; and averred, that since, at that time, guineas were not at a premium, it was a conclusive proof that the currency was not depreciated. To the above opinions, a portion of them continue to adhere\*. The majority, having at length been shamed out of these extravagances, by men who had never crossed the threshold of a counting-house, and who were probably ignorant of the difference between a day-book and a ledger, now stride at once to the opposite extremity of the scale; imagine that this over-issue, which they had deemed impossible, is the one and only source of every evil that befalls the country; and after giving the whole weight of their support to a currency which *was* liable to excess, now join in raising the cry of excess against a currency which is not.

There is yet another class, from which

\* See Mr. Hudson Gurney's invective against the Bullion Committee (*ante*, p. 218). See also the speech of Mr. Thomas Wilson (*ante*, p. 212). "As to the doctrine," says this gentleman, "of limiting discounts, in order to force up the exchanges, be regarded it as one of the absurdities of the day." It is a fact, pregnant with meaning, that a representative of this stamp should have sat in two parliaments for the city of London.

a large portion of our legislators are taken—the country gentlemen; and these, having over the two former the advantage of leisure, and of not having their minds narrowed by exclusive devotion to one particular pursuit, would be, beyond question, the fittest class for the functions of legislation, were their education so directed as to give them either the qualifications of a legislator, or a taste for the acquisition of those qualifications. But—so exquisitely is our system of education adapted to its end—to nine-tenths of them it teaches nothing; to the remaining tenth, nothing but what they do not want: and we consequently find that this class, in qualifications for business, is only distinguished from the other two, by possessing in a greatly inferior degree that diligence and attention, which, from early habit, commonly adhere to those who have been trained in the routine of the counting-house or of the office.

That a legislature thus composed should scarcely ever be *able*, even when it is *willing*, to legislate for a great nation as the wants of a great nation require, is a result which ought to excite neither disappointment nor surprise. By what rule can he, who has no scientific knowledge of the connexion between effects and causes in public affairs, distinguish causation from mere casual coincidence? And what is the quack, but he who confounds the latter with the former? And, accordingly, from time immemorial, it has happened to this country as to others, that its laws have been made by quack legislators, and its affairs administered by quack statesmen; while it is only now and then, at immense intervals, that a man has arisen, who made even an approach to the character of a scientific statesman or legislator. But though this be the deplorable picture which history exhibits to us, it holds out one great and encouraging lesson: That the man of general principles, even though imperfect, has ever thrown the men of tricks and expedients into the shade: That in every age, he who has approached the nearest to the character of a scientific politician, has been confessedly the first man among his contemporaries, and the only one whose reputation as a statesman has long survived him. What was it which made Edmund Burke, with all his errors, (and few men have committed more grievous ones,) soar so immeasurably above the vulgar orators, and still more vulgar

statesmen of his day? What, except that he was a man of general principles? Imperfect, indeed, and in many important points erroneous, those principles were; but they will cause his name to be remembered, when the waters of oblivion shall have closed over the greatest and most admired of his contemporaries, and when the very existence of such men as Pitt and Fox, shall be remembered only by the places which they held.

From his time to our own, in so far only as Mr. Horner is an exception, the only man of general principles who has made his appearance in public life, was Mr. Ricardo. And the ascendancy, which, in the few short years of his parliamentary career, this great man acquired, over the minds even of those by whom he and his principles were abhorred, but who could not avoid feeling the infinity of their littleness when beside him, is an inspiring lesson to all who shall hereafter start in the same career of excellence, and a salutary antidote to the benumbing counsels of those preachers of indifference, who assiduously chaunt the parrot strain that true greatness is never appreciated, and who, by way of apology for their own firm determination to make no attempt at benefiting mankind, strive with all their might to persuade others that mankind are far too foolish and wicked, to render the idea of benefiting them any thing but the dream of a madman.

Of the present ministers, a part have adopted the conclusions which Mr. Ricardo had deduced by logical ratiocination from the most extensive and best established laws of human action; and are so far superior to the mere statesmen of routine. But men born when they were born, educated as they were educated, and occupied as they have been occupied since they entered into life, could scarcely be expected to have attained so clear a conception of those general laws, or so much skill in following them out to conclusions applicable with unerring certainty to the particular circumstances of each particular case, as to be able to tread unassisted in his path. They are so imperfectly acquainted with the principles from which the opinions they have adopted are a deduction, that they are continually liable to make mistakes in the application. So conscious are they of this, that they always seem to be afraid of their ground, and distrustful of their

own opinions: ready to follow implicitly the guidance of any plausible person, the general tenor of whose opinions coincides with their own; but their confidence in others as easily shaken as their confidence in themselves; vacillating, unsteady; and quickly frightened (not by fear for themselves, but by an anxious desire to do their duty, coupled with distrust in their own judgment) into the abandonment even of the opinions of the truth of which they have professed, and with sincerity, to be the most firmly convinced. Thus, on the very subject in discussion,—the subject of a paper currency,—they were at first so eager to put a stop to the circulation of the small notes, that they could not wait for the form of parliamentary sanction, but prohibited, on their own responsibility, the stamping of such notes. Then they grew alarmed at the stories which they heard concerning the discredit into which the small notes had fallen through their over-anxiety to get rid of them in a hurry; and they permitted the issue of the small notes of the Bank of England—beyond all question the worst sort of small notes—for a further period. But now with one accord the Scotch bankers, and all who were connected with Scotch bankers, raised an uproar; in which they were cordially joined by every Scotch jobber, who, hating ministers for the good they had done, stretched a point to oppose them even when they were doing mischief. The great novelist himself took the field, and put forth an entertaining story-book on the currency, in which, between an anecdote and a joke, he wedged in an insinuation, that Scotchmen had not yet forgotten the use of the claymore. Completely bawled down, ministers at length did for the Scotch and Irish currencies, what they ought from the first to have done for the English; they granted a Committee of Inquiry. The result was, that the proposed change was abandoned so far as respected Scotland, and postponed as regarded Ireland: and if ministers have one-half the discernment for which we give them credit, they have long since deeply regretted that they ever hazarded a measure, which has materially lowered them in the estimation of the public, and done no good.

The debates in Parliament were rather marked by general weakness, and igno-

rance of the subject, than by the peculiar absurdity of any one among the opinions which were broached. There was something deserving of attention, however, in the treatment which was sustained by the unfortunate science of political economy. On most questions affecting the public wealth, the party in the right is pretty much accustomed to be taunted, by the party in the wrong, with being misled by political economy. But in the present instance, *each* party was taunted, by the other with having been led into its present errors by that delusive study. Those who were for a gold currency, said, they had never concurred in the theories of the political economists on the advantages of a paper currency. Among these was Mr. Tierney\*, who said that on this point he was more obstinate than on any other, although (he added) he knew that good, wise, and well-informed men differed from him, and although, he, for his part, affected to know no more, and see no farther, than his neighbours. Those who were for a paper currency said, that “excepting only the members of the Political Economy Club, there were no persons to be found who approved of the conduct of ministers†.” Another speaker on the same side, Mr. Hudson Gurney‡, “could not help attributing the source of all the evil to the Bullion Committee. Mr. Horner had come up to it from Scotland to confuse the question with Scotch metaphysics.” From all which it may be inferred, that there were at least some persons on both sides, who, although they differed in their opinions, agreed in their contempt for persons who were wiser than themselves.

Proportioned to the invectives of both parties against “political economy” and “metaphysics,” was the eagerness of each to shew that it had the practical men on its side; and vehement was the contest before they could settle, on which side the practical men really were. Mr. Baring, who agreed with ministers that the small notes were a nuisance, but who pertinaciously opposed their suppression, on the ground (if we comprehend him rightly) that a period of distress was the wrong time for such a measure, made a series of speeches, in one of which, amid bitter complaints of the sacrifices made in

\* *Ante*, p. 314.

† Mr. Ald. Heygate, *ante*, p. 236.

‡ *Ante*, p. 218.

theory, and the disregard shewn to practical men, he exhorted the House to re-collect, that, in spite of all eloquent speeches, it "stood in this situation—the men of business in it, from one end to the other, told the right hon. gentlemen to beware. He did not think there was one banker or merchant in the House, on whatever side he might be accustomed to vote, who ventured to say he thought this measure could be carried without injury to the country. . . . If any practical man would get up and say that this measure could be carried into effect without great suffering, he would give up the point." His call was answered by Mr. Grenfell, who took a widely different view of the state of opinion among practical men. "As a practical man, his opinion was, that not only might this measure be carried with safety, but that there could be no permanent safety for the country without it. There was not a single practical man who would attempt to deny that the one pound note system was a nuisance which ought to be abated; that the evils which now afflicted the country originated in those notes, and that one of the remedies for those evils was to do away with that circulation†."

The word *experience* was of course bandied from one side of the house to the other, and the average number of appeals were made to it from *theory*, by that numerous class, who are accustomed to judge of the wisdom of a measure exclusively by the event. Among these Mr. Brougham's appearance will excite surprise. He candidly owned that he had once been of opinion that a paper payable in gold by law, on demand, could never exist in excess, and that "experience alone had shaken his firm belief in this theory‡." We think that it would have been more to the credit of Mr. Brougham's wisdom, had he remained silent on a subject which it is evident that he had not studied. It is not by merely glancing at the surface of the subject, and making himself acquainted with one or two of the more obvious facts, that a man becomes entitled to say what is or is not *experience*.

Among the speeches, the most deserving of attention, in many points of view, were those of Mr. Baring; and to these alone

we shall further advert. We have not room for an examination of the numerous theories which that honourable gentleman let fall while vituperating theory. But there is one of his theories—his darling theory—the theory so dear to him, that he could scarcely open his lips without pronouncing it, which must be noticed; the theory of a *double standard*.

At present, gold alone is by law a legal tender to any amount exceeding forty shillings, and is therefore the sole regulator of the value of our currency. Mr. Baring's theory was, that it would be a great improvement to make silver a legal tender also. Now, the reasons against this are cogent and obvious. If both metals were made a legal tender, they must be made so in a fixed ratio; say twenty shillings, to pay a debt of one sovereign. But the relative value of the two metals in the market is liable to variation; and, in point of fact, does vary not unfrequently. As soon as this happened, it would become the interest of all debtors to pay their debts in the metal which had relatively fallen. Not only, therefore, would the currency vary in its value with the fluctuations of two metals, instead of those only of one; but whenever one of the two metals became the standard, the whole of the other metal in circulation would be immediately melted.

Though we commonly object to the introduction of figures into a question of political economy, as in general raising more difficulties than it solves, in this instance we think that figures will render our meaning more intelligible. Let us suppose that a sovereign, and twenty shillings, are both of them made legal tender for a debt of one pound; and that this proportion accurately corresponds with the present value of both metals in the bullion market: the quantity of gold in the sovereign, and of silver in the twenty shillings, being severally worth in that market one pound. Let us now suppose that from a falling off in the supply of gold, or an increase in the supply of silver, from the mines, the quantity of gold in a sovereign becomes worth 21s. in silver, or the quantity of silver in twenty shillings becomes worth only 19s. in gold. In the first case, a speculator procures a sovereign with 20s., melts it, and sells it for 21s. In the other, with his 19s. in gold he buys silver bullion, has it coined into 20s. at the mint; and by this addi-

\* *Ante*, pp. 225-6.

† —, p. 227.

‡ —, p. 228.

tion to the currency, raises, among other prices, the price of gold bullion to 21s. when he procures a sovereign for 20s. melts it, and sells it for 21s.

Two evils are thus produced by a double standard: in the first place, double fluctuations; and secondly,—whenever, by a change in the relative values of the metals, one of them becomes the standard instead of the other,—the loss to the nation of the expence of coinage on half the coins in circulation.

Not only did Mr. Baring overlook these arguments, fully and repeatedly as they have been stated in almost all the writings on the subject, but he found, with one exception, nobody to remind him of them\*. What is more, he found several members, and among others Mr. Huskisson†, to express something more than a half assent to the proposition. Mr. Peel also gave a modified assent to it, but with the following sensible reservation:—“It would be necessary to accompany it with a measure to guard against fluctuations in the price of silver, so that if there should be an increase in the quantity of silver, the man who had contracted obligations in gold should not be allowed to discharge them in silver‡.”—No doubt the measure would be harmless with this condition, for it would be nugatory. Where would be the advantage to the debtor of being allowed to pay in silver, if he were obliged to pay it at the same rate, at which he might purchase gold with it, and pay in gold?

It is curious, that every one of Mr. Baring's arguments for two standards, were arguments only for making silver the standard in preference to gold. Such were, the greater facility of obtaining it in the requisite quantities; its being the standard of other countries, which rendered it impossible, unless it were ours also, to have a perfectly accurate par of exchange; the less liability of its value than of the value of gold, to be raised or

lowered by the operations of speculators, &c. &c. All these circumstances may deserve ample consideration, regarded as reasons for making silver the standard, instead of gold; but they certainly are no reasons for having more standards than one.

A discussion of some interest took place in parliament, upon a proposition for authorizing the issue of several millions of exchequer bills to relieve the immediate distress. Ministers refused their assent to this proposition, but, in lieu of it prevailed upon the Bank to make advances to the extent of three millions upon the security of goods.

The propriety of this course appears unquestionable: yet, strange to say, scarcely any part of their conduct excited so much reproach. The practical men not only gave them no thanks for what they did, but would not cease urging them to do what they had refused to do; and ministers were bitterly inveighed against, for unfeelingly suffering such a depth of distress to continue unassuaged, merely because they would not deviate from a general principle, which was not applicable to such extreme cases. Of those from whom this lachrymation proceeded, there was not one who seemed capable of seeing that an advance by the Bank afforded all the relief which an issue of Exchequer bills could afford; probably much more than it would.

Two evils were expected to be remedied by this measure: first, the depression of prices, owing to the contraction of the currency by the immense destruction of mercantile and country paper; and, secondly, the difficulty, or rather the utter impossibility, of obtaining loans, except at extravagant interest. Both these evils were materially mitigated by the advances of the Bank. By these advances, three millions were added to the currency, and three millions were added to the loans. By the issue of exchequer bills, very little would have been added to either. Exchequer bills do not, except to a very limited extent, circulate as currency; and for this reason, neither could they have been of any use as a loan, to the merchant who received them, unless they were first cashed. If cashed by the Bank, they would have operated in the same manner precisely, as the Bank advances upon goods under Government guarantee. If cashed elsewhere, they would not have

\* Sir Henry Parnell was this exception. He said a few words (p. 236) which were characterized, like most of that gentleman's observations, by good sense; but he did not enter at any length into the subject. He said enough, however, to prove that he understood it. On questions of this kind he is generally better informed than almost any other person in the house.

† *Ante*, p. 202.

‡ —, p. 214.

added to the aggregate of loans, but would merely have enabled the holder to borrow money, which otherwise would probably have been lent to some one else. If the measure, therefore, had averted bankruptcy from one individual, it would only be by bringing it upon another. To a certain extent, indeed, it might have drawn out funds, which would not have been lent upon any inferior security; and so far, but no farther, it would have afforded relief. But the advances of the Bank, by immediately superadding the whole of their own amount, to the funds which were already seeking an investment in the money-market, did at once, and to the full extent, what, to a certain extent, the other measure might *possibly* have done.

Yet this measure the practical men pronounced to be nugatory, while their hearts were exclusively set upon the other. One reason they had for this preference; and a curious specimen it was, of the empiricism of the mere practical men, in every thing which they say and do in public matters, and which they call, following experience. The issue of exchequer bills had been tried in 1793, and had succeeded! while the Bank advances had never been tried before! There are few quacks, in tolerable practice, who cannot produce hundreds of instances in which their nostrum has been taken, and in which, afterwards, the patient has recovered. The practical men could produce only one such instance: and even to that, there were objections, to which newspaper cases in general are not liable: for patients, we know, do not always recover, even when the doctor is dismissed; but a commercial crisis *must* abate, some time or other: and if it begins to do so just after the exchequer bills have been administered, people are sure to suppose that had it not been for the drug, it would have continued till doomsday.

Hear how a practical man can rail against theory while in the act of theorizing, and theorizing, too, upon a single instance.

*Mr. Bright:* "What did Mr. Pitt do on that occasion? He issued exchequer bills, and the distress of the country was cured, not only without loss, but with benefit to the state. Why should we now adopt new expedients? Why not profit by the experience and the wisdom of our ancestors? He was no speculatist, no theorist, and disliked the fashionable philosophy of the day, and he asked the country to adopt the wise course of Mr. Pitt\*."

Mr. Tierney made a speech, which, as usual, was full of wit, and pleasantry, and point, but somewhat barren of ideas. The only thing particularly remarkable in it, was the principle of morality by which he professed to be guided in his public conduct: "He approved of the issue of Exchequer bills in 1793. On that occasion he was not in Parliament; but had he been, he would in all probability, like a good soldier, have fought under the banners of his party, and he believed they opposed it: but the measure was sound and good\*."

We commend Mr. Tierney for his frankness; and shall know, hereafter, for what degree of sincerity to give him credit, when he declares to the House, on party questions, that the salvation of the country depends upon its following his advice. We are greatly edified by the notion which he entertains of the duty of a public man. It consists, he says, in in being "a good soldier." Permit us to ask, whose soldier? Not that of the people; for *their* interest is indissolubly linked with every thing that is open, and honest, and sincere. Of whom, then, is he the soldier? We need not go very far for an answer.

The Usury Laws also produced something of a debate. Our sentiments on this subject, having been fully declared in our preceding volume, need not be repeated here. The baneful operation of these laws during the panic having done much to strengthen and spread the opinion of their badness, it was to be expected that the country gentlemen would, in defending them this session, exhibit marks of peculiar irritation. Such marks they accordingly did exhibit; and poured out the vials of their wrath to the very dregs, upon the unfortunate proposer, and upon all who were of his opinion.

Mr. Davenport "called upon Government to take a part in stopping the eagerness for introducing such bills." Mr. Bright, who richly deserves to have been born a country gentleman, "was glad that the bill was thus early opposed. It was essential that the country gentlemen should not be year after year agitated in their minds, and more particularly at a time when they ought to be kept at ease. He condemned in the strongest manner the re-introduction of such a bill as that now submitted for their consideration,

\* *Ante*, p. 256.

\* *Ante*, p. 259.

"it could be productive of no good, and would disturb existing arrangements." On second thought, it occurs to us, that the above observations are ironical. The principal sentence is evidently a sly hit at the extreme sensitiveness of the country gentlemen in money matters, which he artfully represents as having risen to a disease in their minds, and complains that they are not treated with the tenderness due to valetudinarians. Mr. R. Gordon could not contain his indignation against Mr. Sykes, for merely expressing his surprise that the country gentlemen should think the Usury Laws injurious to them. "The landed interest did not stand in need of the suggestions of the honourable member. He condemned the honourable gentleman's avidity to assist the landed gentlemen with new theories; it would be better to allow the country gentlemen to take care of themselves; for surely they ought to be the judge of what suited their own affairs." Had Mr. Bright been in his merry mood when these observations were made, he would have remarked, in continuation of his former view of the subject, that the country gentlemen already began to demonstrate that instinctive aversion to their keepers, which persons in their unfortunate situation so generally display\*.

The only argument which was even named, against the repeal of the Usury Laws, was, that it would shake the security of mortgages; by which is meant that, if higher interest than 5 per cent were permitted to be taken, all mortgages would be called in, and 2 or 3 per cent additional interest immediately laid on. There is something so incredibly silly, as well as something so much worse than silly, in this language, that it deserves most particular notice. In the first place, it is scarcely credible that men should be found in the present day, to stand up and affirm what is here implied, that the lender is the person who fixes the rate of interest; and that too, with full experience before their eyes, that the lender cannot even keep the rate of interest from falling below the legal limit, to say nothing of rising above it. Nor do we believe that even the landlords would have committed so gross and so obvious a mistake, were it not for their inveterate habit of taking their opinions on all money matters from their attorneys;

to whom the Usury Laws, and the evasion of the Usury Laws, are the source of profit without end, and who, therefore, unanimously agree that those laws, and their evasion, are equally indispensable to the security of the social order. In the next place, suppose it true that these laws do keep down the rate of interest on mortgages below its natural rate: is there any set of men, save those who, like the country gentlemen, have so long been accustomed to make the interest of all other classes yield to theirs, that it appears to them almost a miracle to meet with resistance from any other class in the attempt,—is there any other set of men, who would have the assurance to say—We are dealers in corn, and we will therefore compel you to buy it of us at our own price; we are borrowers of money, and we will therefore compel you to lend it to us at our own rate; and all this, not on account of any service which we have done or intend to do you in return, but because we and our pockets are of such vast importance to the nation, and their being well filled so absolutely essential to the maintenance of the constitution and to the prosperity of the state, that no Englishman will grudge to contribute his share, in this or in any other way, towards filling them!

### *Corn Laws.*

THE proceedings of last session on this subject consist in the rejection of Mr. Whitmore's annual motion for a Committee of Inquiry, and the passing of two temporary bills; one for the liberation of bonded corn, at certain duties, and for a limited time; the other for enabling the Privy Council to admit 500,000 quarters of foreign wheat during the recess of Parliament, should such a measure be deemed expedient. *The system of our Corn Laws remains, of course, unaltered.*

In an essay on this subject, last year, we expressed our opinion of what ought to be done with the system. Treading in the footsteps, as nearly as our unequal strength enabled us, of many eminent pre-cursors, we concluded in favour of a gradual abolition of the present restrictions on the Corn Trade.

Session after session has passed away since this doctrine was first established; and we have still to ask why nothing has

\* *Ante*, pp. 319 to 321.

been done towards effecting what *ought* to have been done?

For this inaction there are numerous reasons. Of these, many were produced, in the course of the last session, by those who support the Corn Laws: some, however—and those the most efficient—were either faintly insinuated or suppressed. In those produced, the Corn Laws were defended on the basis of public good: it is hardly so gracious to put forward considerations of private interest as the ground of public measures; and the reasons suppressed were selfish.

In the following remarks, we shall investigate the force of the arguments alleged against a change in the Corn Laws, and endeavour to expose the reasons, to whose silent operation we chiefly ascribe the pertinacity with which a change is resisted.

This mode of treating the subject will present an opportunity for examining with greater detail than our space permitted in the preceding volume of this work, the principal topics advanced by the enemies of a free trade in corn. Considering the unhappy distaste of most men for systematic inquiry, such a service is hardly less essential than the exposition of the principles by which these topics must be judged. The test is furnished in vain, if the reader, through want of time or inclination, declines to use it: we must then apply it before his eyes, and invite attention by promising a relief from labour.

Against this advantage, it is true, we must set off the difficulty of examining a series of remarks having seldom any connexion, and being often at variance, with each other. From this circumstance, our remarks will assume a desultory air; and, from the necessity of resorting to a great variety of arguments, the analysis of each will be less perfect than it might, with more space and opportunity, be rendered. But we need not apologize for a defect inherent, not so much in the arguments we adduce, as in those to which we reply.

I. We begin with that class of topics which rest the defence of the Corn Laws on public grounds. These we may reduce within a tolerable degree of arrangement, by disregarding the order which they follow in the debates—the order in which they severally occurred to the minds

SESS. 1826.

of the individual speakers; and by distributing them as if they had been produced in systematic sequence. This arrangement, which is the most convenient for criticism, will set off the topics themselves to the best advantage.

If an advocate had been furnished with the several topics which occur in the debates of the last session, he would probably have presented them in somewhat of the following order.

He would have dwelt upon the impropriety of altering an existing system (the mere existence of a system, no doubt, presenting one reason against a change; for change is always bad *as change*, being always accompanied, more or less, by inconvenience and loss) upon the strength of an untried and extravagant theory—a theory supported by no facts, in the ordinary sense; and opposed to many. He would have shown, too, the peculiar impropriety of an alteration *now*—when circumstances were in existence which tended to disturb all calculations respecting the change proposed, and which ought, therefore, to be removed before any such change should be mooted. He would have pointed out those circumstances, if any, which made the particular case an exception to the rule upon which the change was recommended; and which might render the existence of the system necessary, even if productive of *some* mischief, in order to avoid *more*. He might then have proceeded to prove that the system was not chargeable, in fact, with the evils imputed to it; that it produced no evil at all; but was productive of positive advantage.

A series of such arguments would lose none of their effect from this arrangement; their probative force would be augmented. On this principle, therefore, we have arranged and shall analyse the arguments in question.

On examining the debates (to which reference will be duly made) it will appear,

1. That the leading objection to a reform in the Corn Laws, is (of course) a general denunciation of inquiry, by attaching the stigma of *theory* to every plan for amelioration; and particularly by “flinging *“dirt”* upon the odious theory of free trade.

2. Follows, in order, a deprecation of inquiry *now*; as well for the usual reasons, as on account of the unsettled condition of the currency.

Descending from these general fallacies,

to fallacies of a commercial order, it is first objected,

3. That the amount of English taxation is a bar to a free trade in grain with countries less heavily taxed:

4. That restrictions on this trade are rendered necessary by the peculiar taxes on land:

5. That it is necessary to secure a remunerating price to the agriculturist:

6. That the existing prohibition was not the cause of the late distress:

7. Further, that it can be the cause of no ill consequence at all:

8. That, on the contrary, it is productive of good, by its effect on prices—by preventing the fluctuations which it is commonly said to produce:

9. And, finally, by relieving us from a dependence on foreign nations for our supply of the first necessities of life.

1. *Reform denounced as theoretical—more especially a Reform on the Principle of Free Trade.*

In our remarks on this question last year, we began by setting forth a long array of those hackneyed fallacies by which the weak, the ignorant, or the designing, never fail to clog the course of discussion. These grovelling sophisms are strewn throughout the present debates with more than common profusion. The question concerning the Corn Trade is interesting, beyond all others, to that class whose minds are deeply imbued with antique opinions, and who, being usually incapable of brandishing the more subtle fallacies, are driven to adopt these coarser instruments of delusion. We thought it, therefore, expedient to remove these incumbrances once for all; and shall henceforth abstain, on their occurrence, from any thing but casual remark.

Of these sophisms, however, that which we have placed first in the foregoing list, and of which the whole virtue consists in nicknaming all inquiry as abstract speculation, and its results as abstract theory—is so frequent and potential: it comes recommended to so large a majority of mankind, by flattering either their ease or their ignorance; by persuading the uninformed that they are just as competent to decide on matters of science as those who have made them the subject of profound reflection; that we deem it worth repeated exposure. Whilst mankind re-

main ignorant as children, they can only be taught like children; and as they cannot be whipped out of their ignorance, they must be shamed out of it. More especially must we try to fix a mark of reprobation on those who encourage the rest in their perverseness, and do all in their power to prevent the diffusion of good sense.—Mr. Whitbread, in one of his Poor-Law bills, proposed to mark the *ill-disposed and disorderly* paupers with the letters C. P., for “Criminal Poor.” By the custom of some parishes, vagrants are branded with the letter V; and in one, we are told that certain paupers are condemned to wear a badge, on which is written, at full length, the inscription, “INFAMOUS LIAR.” To the best of our ability, we will mark the names of those political sophists—those *ill-disposed and disorderly* rhetoricians, who never weary with decrying the use of reason on those vital subjects, in which its application is more important to public happiness than in any other, or in all the other sciences together—with a note of similar reprobation. For this purpose, all that is wanting is to repeat, as often as they are uttered, the very words in which the fallacy is couched. We have accordingly selected a string of passages (without regard, as our custom is, to party or opinion), for the purpose of warning the public against the future attempts of their authors. All are not to be held up as equally guilty; all are not capable of the same degree of guilt. “The malignity of the devil himself” (to use a parliamentary expression) could never impart to the rough work of the under-mentioned baronets and county members half the mischief of the more finished performances of Mr. Baring and Lord Grey. But although the company of the latter cannot implicate the former in their criminality, the company of the former may serve to degrade the latter. Such society, if it cannot elevate, can depress; and although Mr. Irving, in spite of his present appearance in Mr. Baring’s company, is just as much Mr. Irving as before—Mr. Baring has gained no distinction from the alliance.

Sir Thomas Lethbridge began by animadverting on “the resolution of Government to follow up the principle of free trade, in the fullest practicable latitude. He confessed he doubted the propriety and wisdom of that resolu-

"tion, though he admitted that the doctrine was upheld by persons of great rank and exalted abilities on both sides of the house. If the constitution were in its infancy—if other nations surrounding us were about to begin their career along with us, and those principles were admitted and adopted generally—if matters could be so arranged that the nations could all begin *de novo*, and start upon equal terms,"—(if Sir Thomas Lethbridge had caught but one glimpse of the principle he condemns)—"then there could be no doubt as to the propriety of a free trade. But we were an ancient nation—our monarchy was one of the oldest in the world—our commercial system was closely connected with the frame-work of the civil government and constitution. He dreaded any formidable attempts at alteration, for fear that in touching the frame-work of society they might destroy the fences of the constitution\*."

Equally enlightened, and no less exempt from obscurity, are the remarks of another county member, Mr. Sumner.

"The principle of free trade," he tells us, "might do very well in commercial concerns, but it was a frightful and fearful doctrine to apply to the agricultural interests, of which it might probably occasion the absolute ruin. The same rules did not apply to agriculture and commerce. If any branch of trade was injured, there was a disposition in the country to embark its capital in commercial adventures, and the interests of trade would be retrieved. It was not so in agricultural concerns, which ought, therefore, to be more carefully protected and encouraged†."

We are further informed by Mr. Irving—a merchant, and the professed representative of merchants, that, as to the Corn Trade—

"The farmers were well satisfied with the law as it stood: it had worked well for them and for the country. The Corn Laws might not, indeed, square with the present fashionable system of political philosophy—they might not accord with the fanciful theories of the metaphysicians and reviewers of Edinburgh (hear, hear); but, as a plain practical man, he could not help rejoicing in the continuance of a system which had benefited one class without doing injury to another (hear, hear)‡."

We are next saluted with the deep mouthed rhetoric of Earl Grey:—

"Ministers," he said, "had been latterly en-

gaged in making many alterations in our commercial system, in order to increase our means of prosperity. He confessed, that as far as his judgment went, the more he saw of the new principles, the less he liked them (hear, hear). He would not attempt to dispute the pretensions of the teachers of political economy; because, in all humility, it became him to acknowledge that their doctrines were in many instances quite above his comprehension. *The theory indeed was so perfect, that no sufficient objection could be stated to it in argument*; but it generally happened that some little circumstance or other occurred in practice which overturned all theoretical calculation, and ended by producing some great national calamity\*."

Lastly, we have two mortal columns from Mr. Baring, in which from the orderly disposition of the words "currency—banking system—free trade—absenteeism," and other phrases of an economical aspect, coupled with abusive epithets against all sorts of theories and theorists, we presume that a general attack was intended upon the application of the thinking faculty to that branch of political science. We select the following extract:—

"For the science of political economy he entertained a due respect: . . . but gentlemen who had read the books of the political economists, could not fail to know how widely they differed even upon first principles. Instead of their demonstrations being gifted with any thing like mathematical certainty, no two of them drew the same inference from the same promises. *It was a notorious fact, that there were scarcely any two writers on the question of the Corn Laws, who did not differ radically from each other on the most material and important points.* When this difficulty was obviated, and when the learned professors . . . should have established the perfection of political truth, he would admit the force of all their conclusions; but until that consummation should take place,—until the theorists should cease to abuse each other as the greatest of dunces and fools, for not drawing the same conclusions from the same facts, he should consult, before he legislated, the more humble practical man, who looked at the effect, whilst they were calculating upon the cause, and who told them that a thing was not so, when they proved by direct ratiocination that it must be so†."

These are members of the Imperial Parliament. Before proceeding to criticise their speeches, into this worshipful society we beg leave to introduce another guest—a humbler individual, it is true, but one of the same practical order—to wit, Mr. Robert Roe, Secretary to the Chamber of Commerce at Dublin.

In the course of the examinations be-

\* *Ante*, p. 382.

† *Ante*, p. 409: Speech on the Silk Trade.

• *Ante*, p. 29. † *Ante*, p. 336. ‡ *Ante*, p. 365.

fore the committee on the Irish butter-trade, Mr. Roe delivered himself thus:

"Is it your opinion that regulations ever so well framed can be effectually enforced, so as to secure that regularity in the discharge of duty, as to make it at all times satisfactory to the dealers in butter?"

"I am of opinion that no theoretic regulations, no matter how judiciously framed, can secure the practical observance of them."

"What is a theoretic regulation?"

"A regulation under act of parliament\*."

The meaning of all these quotations is precisely the same. The merit of brevity must undoubtedly remain with Mr. Roe, who has expressed in a short sentence what the noble and honourable persons have spun out into many—the fallaciousness "of all theoretic regulations, no matter how judiciously framed:" but the sense is one, and the merit of intention equal.

The fact is, that none of these gentlemen who deal so largely in abuse of economical theories, are acquainted with the principles they vituperate. What, therefore, is the nature of their motive for depreciating the importance of that knowledge—a knowledge which so nearly concerns their pecuniary and political interests—may be understood without exposition. Unhappily, all those who are not in possession of this knowledge, have the same motive to join in decrying it. By such conduct, they bring within their own competency a class of subjects for the decision of which they are wholly unqualified; and so enjoy the dignity of judges without having undergone the trouble of learning the law.

With the absurdities of the professedly ignorant, we have nothing to do. Sir Thomas Lethbridge and Mr. Irving may enjoy the cheers of their admirers without any interruption from us.

It is, however, important to note the extravagant passage selected from the speech of Lord Grey:—"The theory," he tells us—(including the principles upon which a free trade in corn is demanded)—"is so perfect, that no sufficient objection can be stated against it in argument"—(in other words, the theory is true):—

"But it generally happens that some little circumstance or other occurs in practice which overturns all theoretical calculation, and ends by producing some great national calamity"—(in other words, the theory is false).

It is true that the passage in question is worded with such happy ambiguity, that it may be made to bear another, though equally inept interpretation. "The little practical circumstances," it may be said, are not peculiar to *this*, but to all theoretical calculations in political affairs:—the identical proposition of Mr. Roe. That being granted, upon what principle does Lord Grey undertake to intermeddle in political affairs?—and if one plan is as good as another,—that is, if none are good for any thing, upon what ground does he undertake to censure the measures of Lord Liverpool?

Amongst a certain class, Earl Grey has acquired the reputation of a practical statesman: whatever that phrase may designate, we confess the badness of his logic throws a strong suspicion on his practical skill.

Mr. Baring has long been known in the House of Commons as "a great practical authority," and as a constant and able advocate of those doctrines of political economy, with which the educated men of his age had become familiar by the perusal of the *Wealth of Nations*. These qualifications, engrafted on a liberal turn of mind in politics, were the foundation of that degree of eminence which Mr. Baring has enjoyed. Those, however, whose eyes were fixed on the proceedings of Parliament, observed a gradual alteration in Mr. Baring's language and opinions, from the time of the late Mr. Ricardo's appearance in the House of Commons. The reputation of the new member, which threw the old authorities into the shade, wrought a marvellous change in Mr. Baring,—a change which first appeared in the captious objections which he advanced, on every occasion, against the modern economists, and which afterwards extended to some of his own previous opinions. This disposition, which displayed itself in the speech from which the present passage is extracted, in a tone of peculiar irritation, appears at length to have run into a general dislike of all the doctrines which bear the stamp of Mr. Ricardo's genius, or were sanctioned by his approval. For this backslid-

\* Report on the Butter Trade of Ireland, (*Parl. Paper*, 1826, *Commons*, No. 406), p. 153.

ing from his former principles, Mr. Baring received, in the last session of Parliament, a severe, but temperate rebuke, from Mr. Huskisson, in his speech on the Silk Trade; a rebuke which its author justified by quotations from Mr. Baring's former speeches—as we could justify our present observations, were it necessary, from the same source. This rebuke, however, failed in its effect; for the speech in which he gave loose to the bitterest expressions of dislike against Mr. Ricardo's principles, was delivered on the succeeding evening.

Such being the state of Mr. Baring's temper, we refrain from exposing the tissue of fallacies interwoven in his speech; and shall merely deal with his strange assertion respecting the state of opinion on the question of the Corn Laws.

"It is a notorious fact," he says, "that there are scarcely two writers on the question of the Corn Laws, who do not differ radically from each other on the most material and important points."

We have said that the persons who most loudly abuse the economists are least acquainted with their doctrines. Lord Grey confesses his ignorance, and imputes it, too modestly, to his incapacity for such inquiries. Mr. Baring makes no confession; but language so inconsistent with a knowledge of the later works on political economy, is more decisive than any confession. Where are the names which can be set in array against those of all the French economists, of Smith, of Ricardo, of Mill, of Huskisson, of Tooke, of Torrens, of M'Culloch, to show that the economical writers are divided on the question of a free trade in corn?—or what are the "material and important points" which "radically" distinguish those writers in their views of the question?—"I am more and more distrustful," says Mr. Huskisson, "of those practical authorities"—and if this be a specimen of Mr. Baring's practical knowledge, we know of no case which more thoroughly deserves the sarcasm.†

\* *Ibid.*, p. 398.

† It is not a little remarkable that the same unanimity which prevails amongst the leading economists, is to be found in the three principal Quarterly Reviews—the Edinburgh, the Quarterly, and the Westminster. An Essay on the Corn Laws, in the last number of the Quarterly Review, (No. lxix.) affords a singular proof of the advance of sound knowledge on these subjects.

Then mark what it is by which the two sets of inquirers—the theoretical and the practical, are distinguished: observe the grand arcanum of the practical process, for investigating truth—the hinge on which their system turns. It is that, whilst the theorists "are calculating upon causes," the men of practice "are looking at effects." Causes and effects! As if the knowledge of an effect could subserve any useful purpose without a knowledge of its cause! As if science were any thing but the knowledge of causes! When a man takes arms against reason, there is no path which is not full of pitfalls, and no clue by which he can avoid them.

If they who are guilty of this sophistry deserve exemplary blame, it must be useful to hold up to commendation the conduct of those who disavow it. With this view, it is just to refer the reader (strange as it may seem to see reason, for once, on the side of power) to Mr. Huskisson's speeches on the Silk Trade and the Navigation Laws,—to that of Mr. Canning on the former subject, and to the Chancellor of the Exchequer's speech on the Budget. In proportion to the liberality of their views are the attacks directed against them; and in proportion to the virulence of such attacks, are their claims to public approbation.

## 2. *Unfitness of the Present Time—more particularly on account of the unsettled state of the Currency.*

In the course of the debate, exhortations were, of course, not wanting to delay the question. Next to getting rid of an inconvenient subject altogether, the best thing is to put off discussion. So much of the reasons for delay as were grounded on the common fallacy of the impropriety of the time present,—either because the landed interest were but just recovered from the shock of 1820-3; or because they were not yet recovered; or because, so far from being recovered, they were still writhing under the effects of that disaster; or, (to take an opposite line of discussion,) because, whilst all other classes were suffering, they alone were prosperous, and growing in prosperity—for all these topics were adduced as reasons against inquiry now, (by now, meaning never)—we totally omit.

Of these exhortations, however, although all are insufficient, there is one at

least which is not sophistical; and that one derives some importance from the assent it has met with on both sides—from the reputation of the individual by whom it was most prominently urged, and from the general confusion which prevails with respect to the great question which gave rise to it.

In the debate on the Address, Sir Thomas Lethbridge first observed,—and the opinion was unanimously entertained by the landed gentlemen, that “it was clearly improper to bring forward the question of the Corn Laws at a time when the attention of Parliament was likely to be taken up with an important alteration in the currency\*.”

The same objection was afterwards put forward by Lord Grey as a leading and decisive argument:—

“I know,” he says, “there are weighty reasons for declining now to discuss the question of the Corn Laws; and besides the reasons which the noble earl (Liverpool) has given, there is one which he has not mentioned—namely, the state of the currency; for admitting, as he does, the necessity of imposing some duty on foreign corn, it is right, at least, that we should know the value of the currency in which that duty is to be estimated. *This alone is a good reason for putting off the discussion†.*”

So much on the part of the landed interest. On a subsequent occasion, however, we find that Mr. Ellice from Coventry, and Mr. Monck, from Reading, “fully agreed in the propriety of postponing the consideration of the Corn Laws. Until the operation of our late measures with respect to the currency was seen, legislating upon the Corn Laws would only be legislating in the dark‡.”

The whole of this objection rests on the probability of a fall in the nominal price of commodities; or, in other words, a rise in the value of the circulating medium, in consequence of the expected operation of the Promissory Notes’ bill. Thus if, in revising the Corn Laws, it should be thought proper to admit foreign grain on the payment of a fixed duty—the case supposed by Lord Grey; or when the price in the home market should have reached a given amount, as under the present system; it is plain, if the duty or the price should be fixed in a standard

obnoxious to immediate variation from the effect of an impending measure, that “such legislating would only be legislating in the dark.” To fix a duty at 10s. the quarter, when the proportion of the currency to commodities is twice as great as it will be in half a year from the appointment of the duty, is, in fact, at the expiration of half a year, to fix it, not at 10s., but at 20s.

To the argument, drawn from this objection, two answers may be given:—first, that although a change in the currency may affect prices estimated in paper, they may be estimated in a medium which is exempt from all arbitrary changes—namely, in gold: next, that in the particular instance, no change was contemplated which could affect prices at all, either estimated in gold or paper. For the proof of the latter proposition, which involves the whole question of the currency, we must refer to what we have written on that subject. The former is a sufficient answer to the objection, and carries its own demonstration with it. To avoid the evils which might accompany a fluctuation in the value of money, it would only be necessary to provide a shifting scale of duties or prices, which should vary with the price of gold.

It is well known, that, during the Bank Restriction Act, the pound note, from an over-issue of inconvertible paper, suffered a depreciation of  $\frac{1}{4}$  of its value; exchanging, in gold, for 15, instead of 20 shillings. If, before the repeal of that act, an importation duty on foreign corn had been fixed at 10s. the quarter, to continue at the same rate after the return to payments in cash, it is plain that under the same figures two rates of duty would have been imposed; the one, during the existence of the act, amounting to no more than 7s. 6d. in gold, the other, after its repeal, amounting to 10s. To avoid this difficulty, however, we need not put ingenuity to the rack. We have only to note the difference in the value of gold and paper. If it be meant to impose the duty of 10s., value in gold, it may be expressed that when the paper is at a discount of 25 per cent. the duty shall be 13s. 4d. the quarter, gradually descending as paper should rise in value, and fixing at 10s. when gold and paper should be at par.

This expedient, it is true, supposes the value of gold to be exempt from those causes of variation, which affect paper.

\* *Ante*, p. 28.

† *Ante*, p. 343.

‡ *Ante*, p. 378.

vertible, and, according to great parliamentary majorities, convertible paper also. This opinion may be liable to great objections; but it seems, during the long debates on the currency, that no man ever hinted a doubt of the uniformity in the value of gold. In exposing a bad argument, it is no duty of our's to reconcile conflicting opinions; and so long as Lord Grey admits the uniformity in the value of gold, the reasoning we have advanced will stand good, whatever he may think about the variations in convertible paper.

We may here leave the reader to decide upon the *goodness* of an "uncertain state" of the currency, as a reason for postponing the discussion of the Corn Laws. Mr. Hume is scarcely correct in affirming, that between the Currency and the Corn Laws "there is no connexion whatever;" but he is assuredly correct in affirming, that "the Corn Laws are no more a part" of the Currency question than the East India Company's monopoly\*.

Abandoning these barren generalities, we proceed to examine the more tangible objections,—objections immediately derived from commercial or political considerations.

The first of these arguments may be stated in the following terms:—

3. *The amount of English Taxation is a bar to a Free Trade in Grain with countries less heavily taxed:—*

Or, to use the words of Mr. Calcraft, "It is quite impossible to have a low price of corn with a taxation of sixty millions a-year."

Great was the cheering with which this proposition was received,—cheering duly measured, according to the customary proportion between the falsehood or insignificance of an argument and the applause awarded.

Encouraged by the success of his theory, Mr. Calcraft repeats it thus:—

"He was an advocate for a *free trade* in corn,—that was, with a protecting duty. Any other species of free trade would be impossible in this country, on account of the sixty-three millions of taxes to which it was liable†."

Mr. Calcraft's proposition may be construed in two ways. It may be construed to mean, 1. That without a re-

straint on the importation of corn, the present sum of taxes could not be raised; or, 2. That they could not be raised without inflicting peculiar hardship on the agricultural classes.

Before examining these assertions, we shall lay before the reader an account of the items of which the present taxes are composed:—

Net Ordinary Revenues of Great Britain and Ireland for the Year ending January 5, 1826.

\* *Ante*, p. 19. † *Ante*, p. 323.

‡ *Ante*, p. 377.

Having perused these tables, the reader will find some difficulty in discovering how the sum of the present taxes would be diminished by a free importation of corn.

Of the four leading items—Customs, Excise, Stamps, and Taxes—the two first are exclusively taxes on capital or the profits of capital, *not* employed in agriculture: of the two last, some portions are levied on the rent of land, and on agricultural capital and profits,—the bulk, however, being levied on property unconnected with the land. The fifth item, including several miscellaneous heads, is also unconnected with the land.

Of the head *Stamps*, the only items which the landed interest contribute are printed in *italics*: their sum, together with the Assessed Taxes, will be found to amount to 10,228,101l.

It would, of course, be a vain endeavour to estimate the exact proportions in which this sum should be divided between the landed interest and the rest of the community. It is plain, however, that an equal division will be attributing much more to the share of the agriculturists than they really contribute.

An equal division, however, would give the sum of ..... £5,114,050  
Add the Land Tax ..... 1,236,695

Which makes the whole sum contributed by the landed interest ..... £6,350,745

It will hardly be contended that a free trade in corn would produce so great a depression in the trade of farming as to disable the landed interest from paying one half of their present taxes. Men have certainly prophesied the *destruction* of the agricultural interest from a repeal of the Corn Laws: such assertions are in the teeth of every fact and principle; they are not only without authority,—they are opposed to the most abundant evidence: but what men dread without reason, they are apt to believe without proof.

"It is quite impossible," then, "to have a low price of corn with a taxation of sixty millions a year;"—it can only be had with a taxation of *fifty-seven*.

Such is the potency of mere arithmetic in reducing these hyperbolical assertions to their proper dimensions—the virtue of figures of arithmetic when opposed to figures of speech.

But we shall not leave Mr. Calcraft in possession even of his pitiful three millions. Admitting that three millions would be lost by a fall in the price of agricultural produce, what are the considerations which tend to reconcile us to so grievous a defalcation?

We shall not dwell on the consolatory effects of a low price of food, on the scale of allowance to the poor—effects which might probably enable both the landlord and the clergyman to persist in many of their usual indulgences, from which Government extracts at present, we fear, an insufficient tax. We trust the diminution would be small in the tax for their servants and carriages—small in that on their "horses for riding,"—small also in that on their "other horses and mules." If hair-powder be essential to the being of a clerk, a coat of arms is not less so to an esquire: and as to game-duties and dogs, let no man fear to see the day when the Exchequer shall suffer one penny in that item of national revenue.

Not to dwell, however, on this topic, is it likely that the stimulus imparted to manufactures and trade by a rise in the profits of capital, which must accompany a free trade in corn, would not swell the great items of Customs and Excise—the sources of more than two-thirds of our annual revenue—by an amount far exceeding any possible defalcation in the tawdry taxes collected from the landed interest? The real effect of such a measure would be exactly the reverse of that supposed by Mr. Calcraft. Such a measure would increase the national income, and therefore it would increase the taxes drawn from that income: by increasing the income, it would increase the power of accumulation; and therefore it would increase the taxes drawn from capital. It would diminish, in a small degree, the productiveness of taxes on agricultural revenue and capital; but it is impossible to doubt for a moment that it would greatly add to the productive power of the nation\*.

\* "The agriculturists," says Mr. Whitman, "insist upon the necessity of high prices on account of high taxation. The national debt is constantly their theme, as a justification of the Corn Laws, when the *in* policy of the system is demonstrated; but surely they can hardly have considered the rationale of their own argument. All general taxation must be borne by the nation at large; no individual can escape from it; it mingles, in some form

So much for the first construction of Mr. Calcraft's proposition. For the second—namely, "that in the event of a free trade in corn, the present amount of taxes could not be raised without inflicting peculiar hardship on the agricultural classes,"—a few words will suffice.

Taxes are *peculiarly* injurious, even in the first instance, to those only upon whose income or capital they are raised, or to those whose occupation requires the use of certain articles (as raw produce is required by manufacturers) on which taxes are levied.

To establish this construction of Mr. Calcraft's proposition, it would be necessary to shew that a free trade in corn would cause some of those taxes which are now paid by other classes, to be paid by the landed interest. Now, first, the taxes would continue to be raised on the same incomes and capitals as at present; and, secondly, the landed interest would certainly require no greater quantity of materials taxed in other hands, than they require at present. The proposition will not bear inquiry.

Is it, however, possible that, under cover of a magnificent phrase, the speaker may have concealed the very simple idea that, as agricultural incomes and capitals would be diminished by a free trade in corn, *they* (and not the national stock) would no longer be able to contribute their present quota to "the sixty millions?"—and further, that under such circumstances it would be unjust to levy the same amount of taxes on the land, which it yields at present?

We readily admit the proposition that no peculiar tax should be permitted to fall on the land, from any change in the Corn Laws. We advocate equality of taxation. It is one of the great objections to the Corn Laws, that they operate as an unequal tax. "In general," says Voltaire, "the art of Government consists in taking as much money as possible from the many, to give it to the few." This

or other, with the food we eat, the clothes we wear, and almost the air we breathe, in its various direct and indirect shapes. Some of our imposts are, it is true, local and partial; but the remainder of our taxation—the great bulk of it—can never be fairly pleaded as a reason for protection to any one interest, because borne by all."—*Letter to the Electors of Bridgenorth*, p. 25.

Sess. 1826.

is the picture of the Corn Laws. What they give to the landlords, is taken from all who are not landlords. On the other hand, a peculiar tax on the soil would be to take from the landlords and to give to the rest of the community. In either case there is a common word for this process, which those who apply it so freely to the plan for commuting tithes, have never applied to the Corn Laws: we mean *spoliation*.

What the taxes are (and none of them will be found among the "sixty millions") which fall peculiarly on the soil, we shall examine in developing the following fallacy:—

#### 4. *That restrictions on the Corn Trade are rendered necessary by the peculiar taxes on the land.*

This argument is so plausible and popular, and the more so from being not wholly false, that we want no excuse for submitting it to the fullest examination which our narrow limits will allow.

The following are specimens of the language in which the argument is conveyed.

Mr. Benett is reported to have said,

"That if the protection which the land had enjoyed was not continued, not only would the manufacturers find no market for their goods, but it would be impossible that the most important taxes of the state could be paid. It was by the land that the interest of the debt was paid—the church supported—the poor maintained—and the power of the laws, by which the manufacturing interests as much as any others were upheld, was kept in its due force. It was the great bank upon which every thing was drawn for. In one point of view, indeed, it might be advantageous to do away with the Corn Laws, because the certain result of that measure would be to get rid of all the taxes together by destroying the only means of paying them \*."

We find, also, Lord Lauderdale contending—

"That the landed interest was subjected to peculiar burdens to a great extent. The land-tax, called 4s. in the pound, in fact amounted to about 10 per cent on the value of the rent. Did the silk manufacturers, who had obtained a protection of 30 per cent, labour under any such burden as this? The poor-rates and tithes taken together amounted to about 33 per cent on the value of the rent. This was not all; the landed interest were obliged to furnish the means of forming roads, bridges, &c. and to indemnify the owners of property for all losses

\* *Ante*, p. 321.

occasioned by the riotous proceedings of distressed manufacturers. . . . The landed interest was subjected to exclusive taxation amounting to more than 50 per cent on the value of the rent. It was under these circumstances that the present measures were brought forward, and discussions elicited which were more mischievous even than the measures themselves\*."

For similar declarations, see *ante*, p. 325, (Lord John Russell and Mr. Heathcote); p. 336 (Mr. H. Sumner); p. 367 (Earl of Malmesbury), *cum multis aliis*.

Mr. Benett's opinion that the interest of the debt, and, in fact, "all the taxes together," are defrayed by the occupiers of land, is, in substance, the same fallacy as the last, and needs no separate answer. The present proposition asserts, that the land-tax, the tithe, the poor-rate, the county, and other local rates, are exclusive charges on the land, which must be met by a prohibition of foreign corn, or a duty so high as to amount, in fact, to a prohibition.

To understand this question, we must first understand the policy of countervailing duties.

We are told by those who advocate the theory of free trade, that the several countries of the earth have various capacities for the production of different commodities. It is a principal object in production, to produce with given quantities of labour, the *greatest* quantity of commodities; it is, therefore, expedient for every country to apply its industry to whatever species of production may yield the largest returns. Other articles may be purchased from those countries which are endowed with superior facilities for producing them. The advantage of this proceeding is like that which determines a shoe-maker to confine himself to the manufacture of shoes, and to purchase his clothes of the tailor. He obtains his clothes at a cheaper rate, and most commonly of a better pattern and quality.

Whatever, therefore, prevents a country from addicting itself to those branches of production to which it is peculiarly adapted, is, if an act of Government, an impolitic restraint. But to impose a tax on a commodity, is such a hindrance to its being produced at home, by adding to the cost of producing it, that, if it can be produced elsewhere at a smaller cost, the foreign will in time supersede the use of

the domestic article; and thus, by an act of Government, industry may be wrongfully diverted from one of its most prolific occupations. To prevent so injurious a result, it is necessary, when a tax is levied on an object of domestic production, to impose a countervailing duty on the importation of such objects from abroad: by equalizing the price of both commodities, they will continue to meet in the home market on precisely the same terms as before the tax was imposed.

It is scarcely necessary, for our present purpose, to remark, that if the commodity be an object of exportation, the countervailing duty must be accompanied by a bounty, or more properly a drawback of the same amount. The duty protects the domestic article in the home market; the bounty, in the foreign market: the duty, by raising the price of the foreign commodity at home; the bounty, by lowering the price of the domestic commodity abroad.

This precaution is no less necessary with respect to corn than to any other commodity. If, therefore, the land-tax, the tithe, and the local rates, be taxes on the production of corn, it is undoubtedly necessary that a countervailing duty should be imposed on the importation of foreign grain.

Owing, however, to that defect in the productive powers of the soil, with which the reader is familiar as the cause of rent, a tax on the land, as it is vaguely called, may fall in two different directions; it may fall upon the consumer of corn, by adding to the cost of its production, or it may fall upon the rent of land. If it operate in the first of these modes, it must be met by a countervailing duty, to prevent an improper discouragement to the employment of capital in one of its most lucrative channels; if it operate as a tax on rent, no such discouragement will be experienced, and no such duty required. No such discouragement will be experienced, because, in order to attract the foreign article to the home market, the cost of producing the domestic article, and thence its price, must rise. The price of corn, as we explained last year (for the thousandth time indeed—but there can be no end to explanation, except the end of ignorance), is regulated altogether by the cost of growing it on that land which pays no rent. A tax on rent, therefore, can have

\* *Ante*, p. 351.

no effect on the price of corn; it cannot operate as a discouragement to its production, and, by consequence, needs not to be accompanied by a countervailing duty.

If a duty on foreign corn be necessary in the case of a tax on the production of British grain, in order that the course of industry may not be turned from its natural and more prolific channel, it is also necessary for another and a peculiar reason. It is necessary in order to preserve the equality of taxation; in order that the tax may not be shifted from the consumer of corn and fixed upon the owner of land.

If a tax of 10 per cent be levied on the production of corn, and a similar duty on its importation, the consequence will be a rise in price, equivalent to the tax. Under these circumstances the rent of land will remain unaltered, otherwise than as the rise in the price may lead to a more sparing use of agricultural produce, and so contract the sphere of cultivation. But if a tax be imposed without a duty, it will be impossible for the farmers who cultivate those inferior lands, by whose productiveness the price of corn is regulated, to obtain the requisite profit on their capitals. Every farmer who cannot afford to sell at the old prices, in spite of the tax—who cannot, in fact, afford to sell 10 per cent *cheaper* than before—must abandon his employment: for the foreign grower will undersell him to that extent. None, however, can afford to sell at the old prices, except those who formerly paid a *rent* to the amount of the tax. All the rest must quit their occupations, which will, of course, be thrown out of cultivation; whereupon the land which before paid a rent of the same amount as the tax, will continue to pay the tax, but will yield the rent no longer; the destruction of this rent will be followed by a proportionate diminution in all rents of larger amount: in other words, the tax of 10 per cent will cease to be levied on the consumer of corn, and will extinguish an equal portion of the landlord's rent.

It is obvious, from what has been said, that this peculiar reason for imposing a countervailing duty in the case of a tax on the production of corn, is not applicable in the case of a tax on rent itself.

It appears, then, that the only taxes on

agriculture which, in the event of a free trade in corn, would require a countervailing duty, are taxes on the producer—taxes which fall on the means of production, and augment its cost.

Then what are the existing taxes on the cost of producing corn?

Lord Lauderdale, with the vagueness which distinguishes the phraseology of his class, replies, "that the landed interest are subjected to the peculiar burdens of the land-tax, the tithes, the poor-rate, and the county-rate."

This phrase, by the felicitous combination of a verbal with a substantial fallacy, insinuates a falsehood without telling it. It will not be disputed that every tax which is drawn from the land, is, in the common use of language, a tax on the *landed interest*. But if it be meant (as it certainly was meant), to suggest the analogy of a tax on the manufacturing interest, nothing can be more untrue. What is the manufacturing interest? The class whose labour and capital is engaged in the production of manufactures. Any tax—any "peculiar burden" on that interest, is, in its ultimate effects, a *tax on all*. What, however, is the landed interest? The class whose labour and capital is engaged in the production of corn? Yes: and so far as a tax is inflicted on that class, it is inflicted upon all. But the words have a wider meaning. They not only denote that industrious class, but, from an habitual confusion, they serve to denote another class,—the idle and unproductive, but omnipotent class of landlords. The effect of a tax on that class, is understood as soon as it is known from what source they derive their revenues: it is a tax affecting none but themselves, and forms one of the few cases in which we may tax a class without taxing the community. Unspeakable has been the advantage of this phrase—"the landed interest,"—to those whose advantage lies in spreading and perpetuating delusion. It has enabled the land-owners to thrust themselves forward on all occasions as fellow-sufferers with the over-burdened farmers: the farmers it has effectually deceived into the belief of a community of interests with the owners of land, and so difficult is it to draw the line of demarcation, that in most minds the landlord and the tenant—the unproductive and the productive—"the drone and the bee"—are one and

the same class; a tax on one is a burden on both; and a tax on both, like a tax on the manufacturers, is a tax on all. So great is the presumption of the landowners on the prevalence and imperviousness of the phrase, that one of the ablest of the class, who has shewn himself too well acquainted with the fundamental principles of this subject to leave room for suspecting him of ignorance as to the distinction between the landlord and his tenant—in other words, between the landlord and the public—has ventured to print the following sentence—to print and repeat in print, not once, but many times—and to found upon it a scheme of no less magnitude than that of abolishing a third part of the public debt.

"The merchant and the manufacturer, as well as the land-owner, are the producers; the mortgagee and the fundholder the sluggards: every tax on the former is a tax on industry, and capital accumulating; every tax on the latter, is a tax on indolence and capital hoarded\*."

The conception and publication of this passage, demonstrate the confidence of the author in the ignorance of the public.

When, therefore, in reply to the question, What are the existing taxes on the cost of producing corn?—we are told by Lord Lauderdale, that the "peculiar burdens" on the landed interest are the tithes, the land-tax, the poor-rate, and the county-rate (as well as the high-way and other less important assessments), he still leaves a question to be asked—By which portion of the landed interest is the burden of these imposts borne?

The first of these imposts, the Tithes, undoubtedly fall on the producer. Of course, like all taxes on the producer, they fall at last on the consumer, "as much," to use the words of Lord King, "as if the tithe-holder collected them at the oven's mouth†."

The truth of this position is demonstrable by a short analysis. Tithes, where they are levied at all, are a tax on every cultivated acre, of one-tenth of the gross produce; and, being levied on every acre, are levied, of course, upon the

land which pays no rent. It is, therefore, at once evident that they cannot fall upon the landlord: for the landlord can pay no tax where he takes no rent. They cannot fall otherwise than on the farmer; he, of course, could not cultivate such land, unless its produce, after defraying the charge for tithes, would yield the ordinary profits of capital: to do which, the price of produce must rise so high as to cover this triple charge.

Tithes, therefore, although ultimately paid by the consumer of corn, are at first a tax on the producer.

It is not without astonishment that we have seen this opinion questioned, when applied to the case of English tithes. Notwithstanding the cursory manner in which the objection is advanced, the celebrity of the journal, and the ability of the essay in which it has been given to the world, entitle it to a brief review\*.

"It will be found," says the author of the essay, "that by far the largest portion of this sum (the taxes on agriculture) has invariably been paid out of rent, and that it has really no more to do with the cost of producing corn, than the taxes laid on tobacco, or nutmegs. And, first, with respect to tithes: it appears that about a third part of the land of England and Wales is exempted from the burden of tithe, exclusive of considerable tracts in Ireland, and of the whole of Scotland. And such being the case, it is quite idle to suppose that the cultivators of the tithed lands have had any power so to narrow the supply of corn brought to market, as to throw any considerable portion of the burden of tithes on the consumer. Had the extent of tithe-free land been inconsiderable, they might have thrown the greater part of it upon them; but when they have had to come into competition, not with a few, but with a third of the cultivators of England, and all those of Scotland, it is obvious that the price of corn must have been regulated by the price for which it can be raised on the last lands cultivated that are free from tithe, and not by what it could be raised for on the last lands cultivated that are subject to that charge."

The following supposition will illus-

\* *Corn and Currency*. &c. By Sir James Graham (of Netherby), Bart., M.P. Second Edition, p. 106.

† *Ante*, p. 386.

\* *Essay on the Abolition of the Corn Laws*. Edinb. Review, vol. xlv, p. 353.

trate the effects of a *partial* tithe.—Suppose two countries, between which there is no trade in corn, to be exactly equal in population and in the extent and fertility of their soil. If the price of corn in both those countries be 9s. the bushel, the author of the essay will admit that the imposition of a tithe on all the cultivated land in either of them, would raise the price (say) from 9s. to 10s. If a tithe be imposed in one of them, and the corn-trade be thrown open, it is plain that prices will settle at the middle point, that is, at 9s. 6d. From the demand for the cheaper produce of the untithed by the consumers of the tithed country, fresh and inferior land will be cultivated in the untithed; but, for every acre so brought into cultivation, an acre must be thrown out of cultivation in the tithed country; and this process will continue until prices are equalized in both, which will happen when the price shall have fallen in the one, as much as it shall have risen in the other. But if the medium price be 9s. 6d., it follows that the tithe will still be wholly paid by the consumers; because a tax of *sixpence* the bushel on both countries, is just the same as a tax of *one shilling* the bushel on one of them. The same amount will be levied on the consumers; although, being contributed by twice as many persons as before, the tax, instead of a *tithe*, must, in strictness, be called a *twentieth*.

But although no part of the tithe will fall upon the *body of landlords*—although the aggregate rent of both countries will remain unaltered—its distribution, in each, will vary. For what is the process by which the aggregate rent is maintained? It is, that for every acre which is thrown out of cultivation in the tithed, a corresponding acre is brought into cultivation in the untithed country; in other words, that whilst rents decline in the tithed country, they rise in the untithed.

Hence it appears, that in whatever degree the consumers of the tithed country should reap the benefit of the exemption of the untithed, the consumers of the untithed would share in the burden on the tithed; and, that in whatever degree the landlords in the untithed country should gain, the landlords in the tithed country would lose. The amount of the tithe and the rent would remain unaltered: the former would be paid by a greater num-

ber of consumers, the latter received in different portions by the landlords\*.

We have taken (for the sake of convenience) an instance in which the tithed and untithed countries were of equal fertility and extent; but it is manifest that whatever might be the proportion which they bore to one another, the results would be similar. We may, therefore, conclude generally, that a tithe, whether partial or universal (provided it be equally imposed on land of all degrees of fertility), will always be paid by the consumer; and that the only effect upon rent, of a partial tithe, is to raise the value of untithed land by depressing the value of tithed land.

Taking then the tithe-free lands of Great Britain at one-fifth of all the lands in tillage, if we suppose (for the convenience of calculation) that the total consumption of wheat is ten millions of quarters yearly, it follows that eight millions are supplied by the tithed, and two millions by the tithe-free lands. Supposing, too, that the cost of production is 50s. the quarter on the latter, it will be 55s. 6½d. on the former.

The competition of these prices in the market gives an average of 54s. 5½d.: the tithed produce will fetch no more, because it is encountered by one-fifth of untithed produce; it will fetch no less, because there is a demand for ten millions of quarters, of which eight millions must be grown on the tithed soils.

\* It is matter of frequent notice, that from two estates, the one English and the other Scotch, both of the same fertility, and cultivated at the same expense, the landlord's return will vary; the rent of the Scotch exceeding that of the English landlord.—(See particularly Lords' Reports on the Corn Laws, &c. 1813-14: Evidence of Messrs. Turnbull and Brodie. See also Mr. McCulloch's Evidence, in the Fourth Report of the Commons' Committee on the State of Ireland (1825), p. 385.)—Whatever taxes are imposed on the production of English corn, from which the agriculture of Scotland is exempt, will affect the rent of the two countries in the manner we have described above. Of taxes on English production, the chief are the tithe and the poor-rate; and their amount is amply sufficient to account for the difference observed. The rent of the Scotch landlord has been described as "consisting of the difference of the produce of the highest and the lowest soils, and the excess of the actual price of Scotch produce above the remunerating one, produced by the operation of the English tithe,"—and other taxes on farming profits.—(West. Review, vol. i, p. 416.)

The analysis of this statement will demonstrate that the tithe, under these circumstances, will operate as a tax on the consumer—not of one-tenth, but of four-fiftieths, or something less than one-twelfth.

The mistake of this writer—and it is one of serious moment—may be ascribed, without injustice, or rather with a desire to judge him in justice and candour, to the carelessness with which he has applied a general proposition.

If none of the *lowest* soils were tithed; if none were tithed but those which would yield a *rent* of one-tenth of their produce, in case they were tithe-free—it would be true (as we shall shew hereafter) that tithes are a tax on rent. Such, we are willing to believe, was the proposition which floated in the writer's mind when he penned this hasty lucubration: the incident overlooked—the distinguishing incident, is, that tithes are levied on every soil; on the *poorest* as well as the richest.

To prove with how little reflection this opinion was put forth, it is only necessary to observe that, on the back of the same page, which contains the objectionable passage, the poor-rate is unhesitatingly set down as a tax on the production of corn.

Observe the glaring inconsistency.

The poor-rate is a tax on agricultural profits: so is the tithe.

The poor-rate is levied on a *part* of the cultivated land, of which the produce is sold in the British market: so is the tithe.

These taxes then are precisely similar: if “a third part of England and Wales—if considerable tracts in Ireland, and all Scotland, be free from the burden of tithe,” the greater part of Scotland and all Ireland are free from the burden of the poor-rate. “If the price of corn must be regulated by the price for which it can be raised on the last lands cultivated that are free from tithe,” so must it be regulated by the price for which it can be raised on the last lands cultivated that are free from the poor-rate: and yet the poor-rate is admitted to fall on profits, whilst the tithe is said to fall on rent.

To resume the thread of our inquiry, we may repeat that tithes, “although ultimately paid by the consumer, are at first a tax on the producer:” the amount

of the tax will be matter for future calculation.

The analysis of the other taxes on land, the land-tax, the poor and other local rates, is rendered intricate from the peculiar mode of their assessment.

By the acts for regulating the Land Tax, which was made perpetual in 1798, it is enacted, that *real* estates “shall be charged with as much equality and indifference as is possible, by a *pound rate* towards the several sums imposed upon such counties, cities, boroughs, towns, or other places, thereby charged therewith\*.”

The assessment of the Poor Rate is less uniform. In the case of lands and houses, this rate is usually imposed in one of the following ways:—1. On the actual rack-rent; 2. On a rent estimated on valuation, which is resorted to when the property is occupied by the owner himself, or by a tenant who pays less rent than the premises are worth; 3. On an annual per centage calculated upon the purchase money, making allowance for necessary outgoings†. The rate, however, is, in some instances, assessed at so much per acre; and there are doubtless other modifications in the mode of raising it, suggested sometimes by real or fancied convenience, sometimes by the whim of managing individuals‡. “Tithes, coal-mines, tolls, water-works, and saleable under-woods,” are assessed according to the net profits; whilst what is called *personal* property has fortunately escaped, to a great extent, from the imposition of this grievous burden.

From the Report of the Select Committee of the House of Commons, appointed to inquire into the expenditure of County Rates, it appears, “that by stat. 12 Geo. II. c. 29, and 55 Geo. III. c. 51, the county-rate is assessed by the justices, assembled in their general or quarter session of the peace, upon the full and fair annual value of the messuages, lands, tenements, and hereditaments, rateable to the relief of the poor; is raised by the churchwardens and overseers, paid to the high col-

\* 38 Geo. III. c. 5, s. 4.

† See 1 Nolan's Poor Laws, 4th edition, p. 225.

‡ See Appendix to the Report from the Select Committee on the Poor Laws in 1817, *passim*.

"stables, and by them to the treasurer of the county."

This rate is collected with the same diligent abstinence from uniformity which distinguishes the assessment of the poor-rate. It is usually collected by the same persons, and in the same assessment: whatever, therefore, is said of the latter will be implied of the former.

By 13 Geo. III. c. 78, and the other Highway Acts, the assessments for the maintenance and repair of the highways are directed to be made "upon all occupiers of lands, tenements, woods, tithes, and hereditaments," in the several parishes or townships. This assessment, as well as the compulsory attendance for the performance of "statute duty" (a relic of barbarous antiquity) affects the landlord and tenant precisely as the poor and county rates.

Before we can determine by what parties these imposts are defrayed, it is necessary to ascertain the variation, if any, which may ensue from the various modes of their assessment.

If a rate be a pound rate on the actual rack-rent, according to the first method described of assessing the poor and county rates, it will fall entirely upon the rent: for such a tax will add nothing to the cost of cultivating the *lowest* soils.

Thus, when wheat is 50s. the quarter, if 40 quarters be the produce of a farm of the lowest order of fertility, that quantity will be sold for 100l. If a farm of a higher quality of soil be supposed to yield, with the same outlay, a return of 60 quarters, which will be worth 150l., the farmer, being remunerated by 100l., will pay 50l. for rent. Should this farm be assessed to a rate of 5s. in the pound on the rack-rent, it is easy to see that the rate will be deducted from the rent, and not added to the price. The imposition of the rate will not affect the cost of cultivating the inferior farm. Paying no rent, it will pay no rate; its produce will continue to be sold at 50s. the quarter: so also must the produce of the better farm; for there can be but one price in the market for the same commodity, and the *lowest* is the regulating price. But if the tenant of this farm be called upon for 12l. 10s. (the amount of the rate) by the overseer, the landlord must put up with a rent of 37l. 10s. instead of 50l., or go without any rent at all: for so long as the expense of cultivating an

inferior farm is re-imbursed by a return of 100l., the same expense and trouble must be paid at the same rate, when bestowed on any other soil. A tax, then, which varies with the rent, is paid from the rent: it is a tax on the owner of land. The effect would be similar, if the rate be levied, according to the second and third methods resorted to in the assessment of the poor-rate. These are only different means of arriving at the same conclusion. The rent is still the object in view. In the first case, it is ascertained from the terms of an existing lease; in the second, from a valuation by inspection of the premises; in the third, by an estimate calculated upon the price of the estate.

This conclusion, however, must be limited to those cases in which the rent is nothing more than a payment to the landlord for the use and occupation of the soil. It happens in many, perhaps in the majority of instances, that the rent is something more than a reward for the use of the soil itself: it is a reward for the use of the soil, and for a portion of capital invested,—that portion of capital which is expended in the more durable improvements of land, in the construction of drains, fences, roads, farming-buildings, and the like. Whichever of the three methods, first described, may be resorted to in assessing the poor-rate, it may happen that the reward for this capital will be included. It will always be included in an assessment on the rack-rent, where the rack-rent represents the annual value: it will be included in an assessment on the estimated rent, where the valuation is made on the principle of "annual value;" it will be included in an assessment on the annual value of the purchase money, wherever the improvements, as well as the soil of the estate, were the objects of purchase. When the rate is assessed in the second of these methods, it may be assessed on the real rent and the profits of a portion of capital, even where the capital has not been expended by the landlord, but by the tenant; for the tenant, in such case, would be held "to pay less rent than the premises are worth,"—that is, he would pay a smaller sum to his landlord than a succeeding tenant who should take the improved estate, and who would therefore pay for the improvements, as well as for the use of the soil.

With respect to the incidence of a rate

on the annual value, where that term includes the profits of a portion of capital, as well as the rent of the land, it is immaterial to whom the capital belongs,—whether to the owner of the land or the occupier. Wherever a landlord possesses an improved estate, he is, to the extent of the improvements, a capitalist, and a member of the productive class.

It will be found, that a rate on the whole value of the rent, and the profits of a portion of capital, will not be deducted from the rent, but added to the price of corn.

Such a rate would be levied on the lowest soil in cultivation. If nothing were paid for the use of an estate of that description to a landlord,—that is, if the durable investments, the fences and farming-buildings, were the property of the tenant himself, the rate would be levied “on the annual value;” if the landlord received a compensation for the use of these improvements, the rate would still be assessed on the annual value, which, in that case, would be called the rent; for, in common language, by the rent of land, is meant the remuneration of the landlord, whether derived from the loan of the soil, the loan of the durable capital, or both.

If the durable capital invested in the lowest soil be supposed to amount in value to one-half of the whole capital employed, a given rate (say 10s. in the pound) on the annual value of that portion of capital, will be tantamount to a rate of half the amount—(a rate of 5s. in the pound)—on the total return. Now, if, proceeding on the former supposition, 40 quarters of corn be the produce of a farm of this order of fertility, a rate of 5s. in the pound, when the price is 50s. the quarter, will raise the price of the whole quantity from 100l. to 125l., or from 50s. to 62s. 6d. the quarter. In this case, the rate on the superior farm, whose produce is 60 quarters, will be raised to 37l. 10s. The whole produce will be sold at 62s. 6d. the quarter, and the price will be divided thus:—

|                                                         |                |
|---------------------------------------------------------|----------------|
| The returns to the farmer's capital will remain at..... | £100 0         |
| The rate will rise to.....                              | 37 10          |
| And the rent will remain at....                         | 50 0           |
| <b>Total.....</b>                                       | <b>£187 10</b> |

Such a tax, therefore, falling ultimately on price, is, at first, a tax on the producer.

The case of a rate per acre,—that is, on every cultivated acre,—has been considered in the analysis of the effect of tithes. It is also a tax on the producer.

Such being the principles by which the incidence of these taxes must be judged, we next inquire to what amount they respectively fall on the producer of corn.

It has been repeatedly estimated by calculators of all parties,—by those who calculated for a small, as well as those who calculated for a large amount,—that the yearly value of the Tithes in England and Wales is not more than seven, nor less than five millions sterling. The question of tithes has been recently discussed in the *Quarterly and Westminster Reviews*\*. The estimate, in the former journal,—a work in which no attempt would be spared to reduce so unpopular a tax within the narrowest limits—is five millions: in the latter work, a preference is intimated, but no reason alleged, for the larger estimate. Mr. Whitmore, with many others, has adopted the estimate of five millions. To this we shall adhere at present.

The average amount of the unredeemed Land Tax for England and Wales, for three years, (1822, 1823, 1824), was 1,219,322l. Of this sum, a considerable portion, (although we have no means in our possession of ascertaining how much), is levied “upon all ready money, debts, personal estates, offices, employments, annuities, and pension†;” and of that which is assessed on real property, a considerable part must be contributed from other sources than the raw produce of the soil‡. The sums which are respectively assessed on agricultural capital and other sources, may be ascertained by a parliamentary return. It is impossible to suppose that the former sum can exceed two-thirds of the whole

\* *Quart. Rev.* vol. xxix., and *West. Rev.* vol. i.

† 38 Geo. III. c. 5, § 3.

‡ The words of the act (38 Geo. III. c. 5, § 4) are, “all manors, messuages, lands, and tenements, all quarries, mines of coal, tin, and lead, copper, mundic, iron, and other mines; iron mills, furnaces, and other iron works; salt-springs and salt-works; all alum mines and works; all parks, chases, warrens, woods, underwoods, coppices; all fishings, tithes, tolls, annuities, and all other yearly profits; and all hereditaments of what nature or kind soever they be, within England, Wales, or Berwick.”

tax; and on this supposition, we shall have an additional charge on the producer of corn of about 800,000*l.*

With respect to the Poor and County Rates, we are furnished, in the Report of the Committee on the Poor Laws, in 1824, with an account "shewing the amount of monies levied for those rates, in each county of England and Wales, in the year ending 25th March 1823; distinguishing the amount levied on land, dwelling-houses, mills and factories, and manerial profits \*"

The whole amount of the poor and county rates, in 1823, was 6,703,500*l.* This sum is distributed in the account as follows:

|                                 |            |
|---------------------------------|------------|
| 1. Sums assessed on land . .    | £4,602,252 |
| 2. On dwelling-houses, &c. . .  | 1,762,950  |
| 3. On mills, factories, &c. . . | 247,390    |
| 4. On manerial profits, &c. . . | 90,908     |
| Total . . . . .                 | £6,703,500 |

With the second and third of these items, it is manifest we have no concern in this inquiry. The fourth is the sum assessed not only on "manerial profits" and fines," but on quarries, mines, iron-works, &c. and other profits unconnected with the business of farming. By "manerial profits," we presume, are meant waifs, estrays, wrecks, escheats of the goods of felons, heriots, &c.; so that the fines and rents of copyholds form the only item in the sums which demand our present attention. This, whatever it may be, is, of course, an inconsiderable sum; and when it is considered that a tax on the fines and rents of copyholds is a tax on rent, and not on the cost of production, we can have

\* It is proper to observe, that the Committee made the following remark upon this table:—"These returns having been required in a form to which parish officers were unaccustomed, the number of defaulting parishes is very considerable, and the returns which have been received cannot be entirely depended upon. The abstract which your Committee have prepared of these returns is therefore supplied in great part by estimates. They have assumed, that in the whole of each separate county, the proportion which the different descriptions of property assessed have to each other, is the same as in that portion of each from which returns have been received."

SESS. 1826.

no further doubt in excluding it entirely from consideration.

We have only to deal with the first item—the sums assessed on land. These sums are levied on land occupied for agricultural purposes, including nurseries and gardens, and what is more material to remark, including tithes.

From this item it will be necessary to make the following deductions:

*First*, a deduction for the rates on tithes, which are assessed according to the net profits, and must yield a considerable sum. The tithe is itself a tax on the profits of agriculture; what, therefore, is taken from the tithe, for the purpose of being given to the poor, is a tax upon a tax, and adds nothing to the original burden. To include the rates on the tithe amongst "the sums assessed on land," is so far to falsify the account.

*Secondly*, a deduction from the rates on land on which the land-tax has been redeemed, which is tithe-free, or subject to a modus in lieu of tithe. The effect of such exemptions is to swell the amount of rent; and a rate, whether assessed on the rack-rent or the annual value, will be increased in proportion to the value of the exemption. This increase of the rate is obviously a tax on rent, and not on the cost of production.

*Thirdly*, a deduction from the rates, "according to the degree in which they bear on manufacturing and agricultural profits equally \*." By an examination of the account, it will appear that this deduction will strike off little short of half a million from the "sums assessed on land." In proportion as these rates bear equally on manufacturing and farming capital, they are "a general tax on the profits of stock, and occasion no alteration in the price of raw produce and manufactures." But a tax which occasions no alteration in the price, can afford no peculiar motive for the importation of foreign grain: such a tax cannot be classed with those which require the aid of a countervailing duty.

*Fourthly*, a deduction of so much of the rates as are assessed upon the actual rent.

*Fifthly*, a deduction for the decrease in the amount of the rates, from the fall in

\* Ricardo, Principles of Political Economy and Taxation: Chapter, Poor Rates.

the price of corn—a decrease which would keep pace with the fall in price.

With our present defective knowledge of the details of the assessment of these rates, it would be plainly impossible to make these deductions with any tolerable degree of certainty. It is to be wished that the next return may be drawn up with more attention to such points.

We have no means of ascertaining with precision the amount of the last great item of agricultural taxation—the Highway Rate. We shall expend no guesses on the subject, but consult both our own and the reader's convenience by adopting the common estimate of two millions\*. From the mode of its assessment, it must chiefly fall on the producer.

Without taking the advantage, to which the foregoing deductions would entitle us, we shall probably be permitted to assume that the land-tax, the poor-rate, the county-rate, and the highway-rate together, will not exceed seven millions yearly. By adding the tithe, we shall thus have a total of twelve millions for the “peculiar burdens” on the agricultural producer.

Having thus ascertained, sufficiently for the present purpose, the amount of those taxes which increase the cost of producing corn—of those taxes which require the imposition of a countervailing duty, we have only to estimate the amount of the duty to be imposed.

Calculations of this kind have been as various as the views and interests of the calculators. This variety is owing to the want of a fixed principle; and until the principle be recognized, we can expect no uniform result. From the want of this guiding principle, we have one party demanding a free trade without let or hindrance, and another clamouring for prohibition: one party undervaluing the peculiar imposts on the grower of corn, another calling them “50 per cent on the value of the rent.” No rational attempt can be made to establish a fixed duty, until we have ascertained the causes for which the duty is required. Having determined the nature of these causes, and the extent of their operation, the amount of the duty would be settled by the rule of three.

\* See Mr. Whitmore's speech: *Parl. History and Review*, *Sess.* 1825, p. 388.

It is not meant to be asserted that the calculation can be void of difficulty: it would be thick-set with difficulties, were it necessary for any practical purpose to adjust the duty to the tax with arithmetical precision.

To the attainment, even, of this precision (after obtaining amended returns of the agricultural taxes), there is but one thing wanting—one defect which may be remedied by a single order of the House of Commons, precisely as such defects are remedied every day—an order for a return of the number of acres in Great Britain and Ireland paying tithe and tithe-free; with the necessary specifications in cases of composition and modes, and an estimate of the proportion of the tithe, in all cases, to the gross produce on which it is levied.

It is easy to foresee the objections which will be raised to such a course. Without alluding to the inveteracy of the church, it is enough to mention the strenuous disinclination of the landlords. Ascertain the amount of tithes—(an account of the other “peculiar burdens” will be granted with less resistance)—marshal the figures, draw the lines, add, multiply, subtract, divide, and strike the balance;—all the *vague* will vanish, and with it will vanish the guesses, the exaggerations, and the lies. Lord Lauderdale will talk no longer of “the poor-rates and tithes, taken together, amounting to about 33 per cent on the value of the rent,”—(an assertion for which not a particle of evidence can be adduced)—and sum up by declaring that “the landed interest are subjected to exclusive taxation, amounting to more than 50 per cent.” It is undoubtedly more convenient for such calculators to deal with uncertain quantities. Their guesses demand obscurity: they vanish in the light of day.

In the absence of positive documents respecting the amount of tithes, we must make shift with the received estimate of five millions.

It is asserted, we cannot say how probably, that the tithe which is really paid and received, instead of one-tenth, is not more than one-twentieth of the gross produce of the soil\*. Suppose it equal to one-fifteenth: then, the rest of the tax

\* See *Quarterly Review*, *loc. cit.*

on the soil, which have been estimated at seven millions, would be equal to one-eleventh (nearly); or, together, to about 16 per cent. on the whole produce.

Supposing the peculiar taxes on agriculture to absorb the annual value of 16 per cent of the whole produce, the permanent duty on foreign corn should amount to the price of 16 quarters in every 100; or rather, should amount to so much as would raise the price of 84 quarters of foreign grain to the natural price of 100 quarters. We know of no other mode by which the foreign and domestic producer can be put on the same terms. Thus, if foreign corn could be imported at an average of

| The Qr. |                    | The Qr. |
|---------|--------------------|---------|
| 50s.    | the duty should be | 9s. 6d. |
| 45s.    | - - -              | 8s. 7d. |
| 40s.    | - - -              | 7s. 7d. |
| 35s.    | - - -              | 6s. 8d. |
| 30s.    | - - -              | 5s. 9d. |

and so forth.

To the principle of this calculation we can discover no objection: the details undoubtedly partake of the imperfection of the sources from which they are derived. To rectify these, is the business of that class who describe themselves as the most interested parties in the question, and who have been described by others as "the members of parliament, and those who make the members of parliament\*,"—whose power both for good and evil in this, as in all other matters, is not only unlimited but exclusive; by whose aid every thing may be accomplished—without it, nothing. We are the more careful in pointing out the probable infirmity of the calculation, inasmuch as we attach no great importance to its absolute exactness, being rather desirous to denote the principle than to add the figures; inasmuch also as any error in arithmetic would be otherwise laid hold of as a sufficient conclusion against the principle, by men who, predetermined against any thing but virtual prohibition, are less anxious about the method of calculation than the amount of duty. What says this very Mr. Benett, with respect to a calculation of Mr. Whitmore's?—Precisely what most gen-

tlemen of his class would say to any other—"the duty is insufficient."

"His personal opinion had always been in favour of admitting corn conditionally—without regard to home prices—at a protecting duty: as to the amount of that duty, he agreed with the late Mr. Ricardo, that it ought to be just so much as would compensate the landowner for the share he was compelled to bear of the public burdens, and not one shilling beyond; but he had voted against the motion of the hon. member (Mr. Whitmore) a few evenings since, both because he thought the time unfavourable for discussing the question, and the duty proposed insufficient\*."

We invite Mr. Benett's attention to the proposal for rectifying the returns from which we can alone determine the land owner's share in the public burdens to the last shilling, and adjust a sufficient duty.

Imperfect as it may be found, the result of this investigation is at least sufficient to shew how much at random the agricultural party guess, and with how little authority they assert: it is sufficient to shew the exaggeration of their estimates of the "peculiar burdens," and the folly of their demand for prohibition, or prohibitory duties.

It is not, however, to be supposed that we advocate the immediate substitution of a countervailing duty of 9s. 6d. the quarter on foreign grain: the object actually in view is not to fix a permanent duty, but to commence a system which shall terminate in a permanent duty.

In our essay of last year, we observed, when speaking of an immediate measure, that the plan "which would go farthest to meet "the interests of both parties (the "agriculturists and the public), must be "one which would reduce the loss of the "agriculturists,"—a loss which must ensue upon any effective change in the Corn Laws—"to the least amount, by "the slowness of its operation; whilst it "would, in due time, secure to the community those advantages of which they "cannot be justly debarred by a well-intentioned government.—A duty on "importation, regulated at first by the "present cost of producing British grain, "and lessening year by year, till the "average price in our own should exceed that in foreign markets by no "more than would compensate the

\* *Ante*, p. 335.

\* *Ante*, p. 340.

"owners of land for the tithes and other agricultural taxes—seems likely to effect this object\*."

In this opinion we were borne out by eminent authorities. "The best policy," says Mr. Ricardo, "would be, to lay a tax, decreasing in amount from time to time, on the importation of foreign corn, for a limited number of years, in order to afford to the home-grower an opportunity to withdraw his capital gradually from the land†."

The article "Corn Laws and Trade," in the Supplement to the Encyclopædia Britannica, contains the following "excellent suggestions and observations‡:"

"If we shall, at any future period, think of retracing our steps, in order to give time to withdraw capital from the cultivation of our poor soils, and to invest it in more lucrative employments, a gradually diminishing scale of duties may be adopted. The price at which foreign grain should be admitted duty free, may be made to decrease from 80s., its present limit, by 4s. or 5s. per quarter annually, till it reaches 50s., when the ports could safely be thrown open, and the restrictive system be forever abolished. When this happy event shall have taken place, it will be no longer necessary to force nature. The capital and enterprise of the country will be turned into those departments of industry in which our physical situation, national character, or political institutions, fit us to excel. The corn of Poland, and the raw cotton of Carolina, will be exchanged for the wares of Birmingham and the muslins of Glasgow. The genuine commercial spirit, that which permanently secures the prosperity of nations, is altogether inconsistent with the dark and shallow policy of monopoly. The nations of the earth are like provinces of the same kingdom—a free and unfettered intercourse is alike productive of general and of local advantage."

To these opinions we fully adhere. Our reasons for adopting them were ex-

pounded in our essay of last year, and need not be repeated.

##### 5. *Necessity of securing a remunerating price to the agriculturist.*

Having explained the mode of providing for the proper incidence of the "peculiar burdens" upon agriculture, under a system of free trade; having shewn what securities must be adopted for preserving to the country the full benefit of its natural facilities for the production of raw produce, in despite of these burdens; having shewn to what degree it will be necessary, for that purpose, and in order not to inflict an unequal pressure on the land-owners, to prevent the price of raw produce from falling so low as it would fall under a system of perfect freedom—it is time to inquire what is meant by the land-owners themselves, by their phrase of "a remunerating price."

We are unable to attach any other meaning to the term than that which we have just explained;—a price sustained by a countervailing duty, at such a rate as to ensure the cultivation of those soils which, owing to the pressure of peculiar taxes, could not otherwise be tilled at a remunerating, that is, at the ordinary, rate of profit. This, however, is not the meaning of the agricultural phrase.

"The present price of corn," says Mr. Sumner, "is not more than a remunerating one; under sixty shillings (the quarter) corn can never be grown permanently in this country\*."

So much for Mr. Sumner's idea of a remunerating price. From what follows, the reader will perceive that Mr. Calcraft's is at least as meritorious.

Lord Milton, in one of those speeches which have rendered him so justly popular, had observed, that—

"He was told upon all occasions, that it was necessary that the landed interest should have a remunerating price. Now, what did a remunerating price mean? Ample rents to the landlords, and ample profits to the farmers (no, no). Then, what did it mean? By a remunerating price, he repeated, was meant, that ample profit should be secured to the farmer on the outlay of his capital. Now that evidently depended on the amount of his rent. The whole question referred to the advantage of the farmers and landowners, or rather of the landowners entirely. A remunerating price, let it be considered as it might, resolved itself into the attainment of ample rents."

\* *Ante*, p. 361.

\* Parl. Review, *Sess.* 1825, p. 701.

† Principles of Political Economy and Taxation, p. 312, third edition.

‡ These are the words of Mr. Ricardo, from whose work we quote the passage.—(Principles of Political Economy, &c. *loco citato*).

Whereupon Mr. Calcraft replied, that—

"He would tell the noble lord what a remunerating price was:—it was 3 per cent on the money vested in the land, and 5 per cent on the capital expended upon it. Surely that was not an extravagant rate of remuneration \*."

Lord Milton is evidently right: "the whole question refers to the advantage of the farmers and land-owners;" and when Mr. Sumner speaks of 60s. as the remunerating price, and Mr. Calcraft of 3 per cent on the purchase-money of land, with 5 per cent profit on the capital invested in the business of agriculture, they only substitute definite terms for Lord Milton's general expression. Lord Milton talks of "ample rents;" nay, says Mr. Sumner, not "ample," but 60s. a quarter: not "ample," repeats Mr. Calcraft—"not extravagant,"—but 3 per cent and 5 per cent; that is our remunerating price. Others have talked of 65s., 70s., 75s., and 80s.; and doubtless there are not wanting many who inwardly ejaculate, "not 60s., not 80s., but 100s."

If 60s. be the price at which corn would be sold in England, under a duly regulated importation, Mr. Sumner himself would admit that there would be no need of a corn law for the purpose of effecting his object. Such a law would be inoperative to any purpose but that of elevating prices beyond their natural standard; and if the natural standard should, in fact, be less than 60s., Mr. Sumner would also concede, that, in the ordinary use of language, 60s. not being the natural price, would, if not "extravagant," or "ample," be at any rate a high price. It is, therefore, absurd—it is disingenuous—to deny that a remunerating price, so far as that term is used as an argument for the Corn Laws, is a synonyme for high price. It is one of those "impostor terms, by which, in order to justify or disguise a thing indefensible under its real name, recourse is had to some more general term, which, together with the indefensible thing, includes others, which are objects of approbation." Now the talk of "remunerating" prices is undoubtedly a pleasant talk: it suggests the agreeable ideas of merit and reward; a merit to be recompensed, and a reward wherewithal to recompense it. Under this prepossessing

phrase, the question is presented as involving a right and an obligation: a right on the part of the landed interest, to remuneration for service done; an obligation on the part of the community, to defray a debt incurred. But "high" price—a high price of corn—is a phrase of sinister import. It is a declaration of war against the belly—a note of hostile preparation, at which every man, who dines, is warned by the watchful monitor which prompts him when and how to dine, to bestir himself; lest one of the pleasant breaks in the routine of daily life be cut off, or the abundance of the whole impaired. Such is the force of words!

Having disposed of the name, we may now apply ourselves to the consideration of the thing—to the consideration of the expediency of high prices.

This may be dispatched in a few words—by a reference to what has been said upon the principles of the Corn Laws: for to talk of high prices under the name of remuneration, is no less than to set aside these principles by a word—to beg the question by changing the term. So long as foreign countries afford their customary abundance, it is impossible for prices to exceed their natural level. Under such circumstances, restraints on importation can alone produce high prices. We have shewn, and need not repeat—in fact nobody ventures to deny—that high prices are the cause of high rents and high tithes: we have also described them as the cause of low profits. We have observed that the interests of the landlord and the taker of tithe are promoted by high prices, and explained that the farmer who is saddled with a long lease, under the present artificial system, though interested in raising the rate of profits, has often a stronger motive in the opposite direction; as the abandonment of the inferior soils, which could alone raise the rate of profit, would greatly impair, if not destroy, the capital vested in such soils. These parties are all naturally appetent of high prices, and their clamour is commensurate with their power. All this is natural enough; but is it useful?

It is useful only to themselves. The "remuneration" of this confederacy, is a remuneration at the expense of the community. To remunerate the lease-holder, prices must be raised so high as to afford a profit on the capital which he has laid out

\* *Ante*, p. 378.

on inferior soils. This excess of prices must be paid from the pockets of the people. To remunerate the landlord and the clergyman, the rent and the tithes must be kept at their present standard—kept up by high prices also; which must also be paid from the pockets of the people.

Having pointed out the meaning of the phrase “remunerating prices,”—having shewn by whom they are paid and by whom received, any further remark would be superfluous. In justice, however, to Major Maberly, we must quote his language upon this topic:—

“He opposed the right of the agriculturists to what they called a ‘remunerating price,’ upon the ground that there was no saying at what point that remunerating price would stop. By bringing poor lands into cultivation it might be raised even thirty or forty per cent higher than it was at present\*.”

In fact, forty years ago it was thirty or forty per cent less; and should the system be vigorously pursued, there can be no reason why it should not be thirty or forty per cent more than it is at present. As the merit of the landed interest is infinite—the merit of keeping all they get, and getting all they can—so is their claim to remuneration. The higher their rents, the louder their clamour for protection. They need protection, to make them rich; they need it to preserve their riches. Like the daughter of the horse-leech, their cry is continually—“give, give.”

6. *The existing restrictions on the Corn Trade were not the cause of the late distress.*

Having shewn, by the three preceding arguments (Sects. 3, 4, and 5), their claims to the protection they enjoy, the advocates of the landed interest proceeded to prove that that protection is no injury to others; and, to substantiate the assertion, they allege that the Corn Laws were not the cause of the existing distress, either amongst the manufacturers or the labourers. Thus, in an early debate in the last session, Mr. Curwen said, “that the manufacturers of England were grossly mistaken, if they attributed any part of their distress to the operation of the Corn Laws†.” And

Lord Malmesbury assured the House of Lords, that “he would only ask one week, and would undertake in that time to prove, by the testimony of five or six honest manufacturers—(note, 1. no manufacturers are asked who hold the opposite opinion; 2. honesty in the place of knowledge)—that not only their present distress was not attributable to the Corn Laws, but that any alteration of them would be calculated to increase that distress; for, if it increased the distress of the other class of the community, it must of necessity increase their’s\*.”

Similar assertions were pronounced as to the causes of the present distressed condition of the labourers.

To both these propositions we give a qualified assent.

In speaking of causes, it is often useful to discriminate between those which are proximate and those which are remote. It is certainly foolish to assert that the corn monopoly is the proximate cause of the existing commercial difficulties. On this point, Lord Milton may be cited with approbation:—

“He was not,” he said, “absurd enough to suppose that the Corn Laws were the sole cause of the distress, but he had no hesitation in saying that in one respect they had a great effect in producing it, and that was in the interruption which they gave to the commerce of our manufacturers with foreign countries†.”

This is the precise distinction. A course, which tends to embarrass the freedom of commerce, tends also, if not in its immediate, at least in its remote operation, to counteract the self-regulating tendency between supply and demand. It is by no means easy to ascertain, at particular periods, the respective wants and powers of supply, of inter-commercial countries: slight circumstances are often sufficient to mislead, in this respect, the judgment even of experienced merchants: a harvest partially plentiful or partially defective,—a sudden decline or increase in the demand for a particular article,—any circumstance, in fine, which unexpectedly affects the market-price of important commodities, is too apt to be misconstrued into a general deficiency or a general surplus. How much more difficult does it become to distinguish between the

\* *Ante*, p. 336.

† —, p. 27.

\* *Ante*, p. 368.

† —, p. 376.

varying indications by which the operations of trade are directed, when a cause is at work in either country which tends to generate fluctuations in price, sometimes both rapid and extensive,—more especially when, in addition to this tendency, it has the further permanent tendency to depress the rate of profits, and thereby to stimulate speculation precisely in the conjuncture in which it is most hazardous, and needs rather to be discouraged than excited? Such, however, is the tendency of all restraints on the importation of raw produce; and, in whatever degree the Corn Laws may have produced this effect in England, in that degree they have been an ultimate cause of the present embarrassments.

First, then, it is not wholly true, that “no part” of the existing distress is attributable to the Corn Laws: and, next, were it as true as the testimony, not of six, but of six thousand “honest manufacturers” could make it, how would it follow that the Corn Laws have no mischievous effects in other shapes and seasons?

Lord Lauderdale entertains an opinion respecting the effect of the Corn Laws on the wages of labour, by which he proves that a high price of corn has no tendency to depress the rate of profits. He observed, that—

By referring to documents which were before the house, he learned that in those years when grain was dear, labour was generally cheapest; and *vice-versâ*. On a former occasion, to illustrate this principle, he sent to Glasgow, and got the price of weaving a certain article for thirty years, and compared it with the Windsor price of wheat. The result was, that precisely as corn rose, the price fell. This was not the case with manufacturing labour alone,—the principle applied equally to agricultural. Mr. Milne, who had been examined before a committee of the house, had stated that in enclosing a farm, the portion of work which in a cheap year cost five shillings, was got done in a dear year for half-a-crown\*.

Lord Lauderdale, however, has not furnished us with the rationale of this statement; that, it will appear, would scarcely have served his purpose†.

\* *Ante*, pp. 326-7.

† For a more complete statement of his views, in Lord Lauderdale's own language, the First and Second Reports from the Committee on the Corn Laws, 1813-4, we presume, are “the documents” referred to by Lord Lauderdale in the present passage. See also the evidence of Mr. Milne, in the same Reports.

It has been observed by M. Say, that during the high prices of 1811 and 1817 in France, the wages of labour declined, instead of rising\*. The same circumstance occurred in England, in 1815, which was also a year of high prices. The difficulty of getting bread, he remarks, compelled more people to resort to manual labour than were usually so employed, and obliged those who were habitually engaged in it to exert themselves beyond the ordinary rate. From these causes a glut took place in the supply of labour, and of course a corresponding fall in its price. The effect, however, of such a fall, at such a period, both upon the numbers of the people, and their capacity for working, is evident. It cannot but diminish both,—a diminution by which the rate of wages is restored; and thus, with the return of low prices, we are met by a rise in wages. It is not less evident, however, that fluctuations of this kind must be but of short duration. If corn, instead of falling, were capable of maintaining a high price for a lengthened period, the diminution in the numbers of the people, and in their capacity for working, would raise the price of wages just as much, and, in fact, much more than in the opposite case of a fall in the price of grain. It is also certain that a continuance of a low price of grain, by affording a steady stimulus to the increase of population, would ultimately produce and perpetuate a low rate of wages. Wages may not correspond with the price of corn at particular periods, and for short spaces of time; but, in the absence of any check to population, they always accommodate themselves to it in a series of years.

This explanation will not accord with Lord Lauderdale's views. It was his object (we can see no other) to shew that the high price of corn was not detrimental to the manufacturers, as it procured them not dear, but cheap labour. To be sure, in this calculation, he wholly overlooked the mischief inflicted on the labourer. He attempted to unite the interests of the manufacturer and the agriculturist, by shewing their mutual gain by a law for depressing wages. The oversight was not unnatural; but it justified Lord King's rebuke, that—

\* *Economie Politique* (quatrième édition), tom. ii. p. 109. not.

"Those who made corn dear, knowing that labour was at the same time to be cheap, were guilty of tenfold more injustice and cruelty to the poor than he had ever ventured to impute to them."

We have shewn, however, that so far from producing permanently cheap wages, the effect of a high price of corn is precisely the reverse. It will also be inferred from what has been said above, that those temporary high prices, which are all that the Corn Laws can bestow, so far from benefitting the farmer (for he, too, is included with the manufacturer in Lord Lauderdale's calculation), by a reduction of wages, of which the benefits, such as they are, can be but of brief duration, only aggravate the precariousness of his condition, by adding to the evil of low prices, whenever they occur, the additional evil of high wages!

To whatever light we turn this subject, it presents us with a scene of unvaried disaster, unless, indeed, we except a single class; and even that class exaggerate the benefits which they derive from so mischievous a source.

The present distress, however, of the manufacturing labourers can hardly be attributed to the Corn Laws, either in their immediate or remote operation: the heavy fall in their wages is the obvious effect of the previous distress of their employers; the dreadful extent of suffering which that fall has occasioned is no less plainly the effect of the excessive number of those who compete for manufacturing employment. Had the general and permanent rate of wages been considerably higher before the late convulsion, they could not have fallen so low: had the numbers of the people been considerably less, the permanent rate of wages would have been considerably higher. Under such circumstances, the labourer might possibly have been deprived of the comforts, but hardly of the necessities of existence. As it is, we have seen the English operative exposed to an occasional fall from tolerable food and lodging to feed upon brewer's grains, Butter-milk and potatoes admit of no economy, and in times of periodic scarcity, the Irish peasant has no resource but death.

"We cannot, therefore, agree with those who hold up the Corn Laws to the common people as the great cause of

their distress. This, we think, is an injurious delusion. There is only one cause worth speaking of, which perpetuates in this country the degradation of the labouring class. That cause, it can never be repeated too frequently, is the excess in the number of the people. To ascribe their poverty to any other, is only to mislead them. If corn were double its present price, the people, by limiting their numbers, might have as much of it as they wished; if it were twice as cheap, at their ordinary rate of increase, they would be shortly as poor as ever."

This was our language on a former occasion: it was dictated by a deep persuasion of the insignificance of all artificial causes in regulating the amount of wages, and thereby the happiness of the people; it is repeated with the same conviction, and with a sincere desire of removing from the public eye whatever obstacle may have been interposed, by design or ignorance, to conceal the all-effective causes of the misery and debasement of the labouring class.

Granting, however, that the late distress is not justly attributable to the Corn Laws, how, it may be asked, can this concession affect the general question?

There are many, perhaps most men, more especially in matters of no immediate personal concern, whose opinions are habitually decided by the last striking circumstance which may happen to attract their notice: they willingly shut their eyes to the uncertainty of this mischievous habit of trusting to last impressions, in favour of its facility; and, although such impressions are more liable than any others to be estimated above their value, so liable is that fact attended to, that they insensibly sway the judgments even of able and cautious men, and fling for awhile into the shade all previous evidence, however carefully received. The influence of this habit was exhibited in a striking degree during the recent discussions on the Corn-rency. It was in vain to recall attention to evidence recorded, and principles established; the fact—the late fact—was irresistible.

In concurrence with this habit, many members of parliament appear to have conceived, that if the Corn Laws were the cause of the late distress, they can never

\* *Ante*, p. 327.

\* *Parl. Review*, *Sess.* 1825, p. 698.

be the cause of any. To guard against this conclusion, it seemed necessary to state the fact respecting the connexion of those laws with the recent embarrassments, and its proper limitations. This, therefore, being done, we may proceed to the assertion, next in order,—

7. *That the Corn Laws are productive of no evil effects whatever*,—a bold proposition, for which we are obliged, on this occasion, to Sir Francis Burdett.

This fallacy requires notice, rather from the celebrity of its author than from any importance of its own. Sir Francis Burdett's position rests on an ignorance of the simplest principles which regulate the production of wealth; and on the misstatement of a notorious fact. So glaringly fallacious is this argument, that Sir Francis Burdett has unconsciously suggested the means of refuting at the moment of announcing it.

"Nothing," he observed, "could be more clear than the fact that there could be but one interest between the agricultural and the manufacturing classes; the only reason that England had so large a body of manufacturers—the only reason why she was enabled to support them—was, that her agriculturists produced with so little labour so much more than was needful for their own consumption. The living of each party being made out of the exertions of the other, it was impossible that either could be rich without their prosperity being mutual. The more the agriculturist's labour produced, the more he had to sell to the manufacturer; the less exertion the manufacturer had to lay out upon his commodity, the more the agriculturist received in the exchange. This was the plain and simple view of the question\*."

Again:

"The more food there was for the manufacturers, the more manufacturers there would be; the more their skill would be excited, and the greater return there would be for the produce of the agriculturist. It might be that a part of that food came from abroad; but it was, in his estimation, of little consequence where it came from—whether grown in this country, or dropped from heaven, like manna—the advantages would be the same†."

In this theory, we note two capital defects—error in the principal fact, and vagueness in the principal term. Using the term labour in the sense which has certainly been given to it by economists of great repute—as including not only wages but capital—it is uncontestedly true, that the manufacturer

and the farmer will each obtain more in the exchange of their respective commodities, according to the cheapness—in other words, the smallness of the labour, with which they can respectively produce them. Taking the word in this sense, we learn from a very slight acquaintance with first principles, that the farmers of a country where the landlords receive the highest rents in the world, cannot possibly sell their corn at so cheap a rate as the farmers of other countries—that they cannot produce a surplus "with so little labour as to give the manufacturer the greatest possible quantity of raw produce in their mutual dealings." To say, in despite of facts which we will not describe, that a surplus is so produced in England, we attribute to pure forgetfulness. It is beyond controversy that a given quantity of British manufactures will purchase, at this instant, one-third more of foreign than of British corn. To assert, therefore, that "it is of little consequence whether the food be grown in this or another country—try—that the advantage would be the same,"—is a paradox which admits of no exposure more effectual than a bare re-statement.

It is, however, important to untwist this knot of words, so as to leave no room for cavils. It has been observed, that by including in the word labour the whole capital employed—as well that which is laid out in machines and implements, and what, in speaking of land, are called improvements, as that which is set apart for the payment of wages—Sir Francis Burdett's proposition is correct. In that sense, it would be true that the smaller the quantity of labour bestowed on a commodity, the cheaper it would be; and the better, of course, for the consumer. Now, Sir Francis Burdett asserts, that corn is produced in this country with less labour than in any other. He grounds his assertion on "the fact, that so small a number of persons as compose the agricultural body, one-third of the whole population, are able, by their skill and industry, to raise sufficient produce to support the other two-thirds . . . Now there is not in the world any other country in which one-third of its population maintains the other two-thirds by their industry\*."

\* *Ante*, p. 337.

† *Ibid*.

Sess. 1826.

\* *Ibid*.

4 T

But if by *labour* Sir Francis Burdett means the quantity of *present labour*, (which is plainly his meaning here)—if he excludes the quantity of *hoarded labour*, (or, in other words, of capital)—his original proposition is no longer true. It ceases to be true, in that case, that the price of commodities is regulated by the labour expended on their production. We must introduce another element—that of capital: and so soon as we shall have defined the price of commodities to be regulated by the quantity, not of labour, but of labour and capital, laid out in their production, it will require no discussion to prove that the *number* of labourers employed has nothing to do with the question: the question can then be only settled by determining the whole amount of capital employed in advancing the wages of labour, in procuring the implements of tillage, and *improving* the soil. Sir Francis Burdett will not assert that corn is grown in foreign countries at so great an expense, although the land may be tilled by a greater number of labourers than in England. The smallness of the number of agricultural labourers in England, when compared with the population, may prove the advances she has made in the accumulation of wealth; but it does not prove what it is alone essential to prove, that English corn can be brought to market as cheap as foreign corn—that whilst the English manufacturer is compelled to feed his labourers with English corn, he does not pay a higher rate of wages and receive a lower rate of profit, than he would do if permitted to feed them with foreign corn—that the consumer does not get less bread for the same money—in fine, that the Corn Laws, so far from being productive of “no evil consequence to any class,” are not productive of exceeding evil to many classes—to every class but the owners of land and the tithe of its gross produce.

This theory, however, in the hands of its present author, has the merit of being simply wrong: it is not produced for the purpose of screening the monopoly; in the same breath with which he utters a fallacy which might be used in defence of any monopoly whatever—and it is therefore only that we notice it—Sir Francis Burdett disclaims all wish of perpetuating the Corn Laws, and declares in favour of free trade.

8. *That the Corn Laws are productive of good, by their effect on prices—by preventing the fluctuations which they are commonly said to produce.*

We now arrive at the climax of the reasoning in favour of the Corn Laws. The reader has been hitherto conducted through a series of apologetic arguments, tending to shew the justice of that system as it regards the agriculturists, and its innocuousness as it regards the public. The logic of the landlords now assumes a higher strain. It deserts the narrow ground of selfish interests, and challenges public applause by appealing to the principle of general utility; by endeavouring to establish a connexion between the monopoly of corn and the prosperity of the public. It is true, that the course pursued, in the hands of the different speakers, requires a different ground of defence, as it proceeds on opposite principles. It is better to present the reader with a specimen of each.

For the sake of impartiality, we have taken the first passages which offend. They stand in the following array:

The Marquis of Salisbury: “What ever might be the theoretical objections to the Corn Laws, they had the practical merit of securing low prices, and thereby contributed most materially to the interests and well-being of that very class of persons who were led to view them as an evil,—he meant the manufacturing interests\*.”

The Earl of Lauderdale: “It was better for the country at large to have steady and moderately high prices, than fluctuating low ones . . . . *Extremely high or low prices of grain were equally injurious to the country*†.”

Mr. H. Sumner: “Though he had not read many books on this subject, he had read the book of experience. That book was uniform, and, except in two years, when high prices were caused by great scarcity, he had always found that years of high prices were years of prosperity to all classes, while years of low prices were those of the greatest distress‡.”

These, no doubt, are all specimens of practical reasoning; specimens of the uniformity of those who pursue with contempt and ridicule the disputes of the

\* *Ante*, p. 369.

† ——— p. 334.

‡ ——— p. 336.

political economists. We shall consume no further space in commenting on these passages; we leave them, with confidence, to the effects of juxtaposition; to the application of principles we have before established; and more especially to those which will flow from the inquiry we are now about to institute.

By those who have considered this subject in all its bearings, it seems to be generally agreed, that restrictions on the Corn Trade are in no respects more injurious than in their tendency to create fluctuations in the price of grain. In our essay last year, this tendency was represented as the paramount evil of the system. Of the fact itself, the demonstration seemed to be complete; it had long been received as one of the indisputable points, and was admitted even by those who were most deeply interested in disproving it.

But time, the great innovator, amongst the other prodigies of last year, gave birth to a theory more agreeable to the views of the agriculturists, by which a new doctrine was established:—that the Corn Market is best regulated by act of parliament—that the Corn Laws present the only means of restraining within the narrowest limits the fluctuations which are naturally incident to the trade in grain.

Pursuing that route of experience, which had already conducted him to so many brilliant discoveries, Lord Lauderdale is said to have propounded the following facts:—

“When he wished to acquire knowledge on any subject of this kind, he always looked to the experience of past times, and that experience shewed him that the constant admission of a foreign supply of corn was calculated, beyond all other measures, to create frequent alterations in its price, without sensibly diminishing its value. It would be found in the history of this country, that by an efficacious law, passed in 1670, in the reign of Charles II.\*, before foreign corn could be admitted the price in the market here must have risen to 50s., which, with the duty of 11s., brought the importing price to 61s. Looking to the value of money at that day, that sum was equal to 164s. at the present time. During the first thirty years after the passing of that act, they had wheat at 39s. per quarter. That system was continued down to 1765, and during the last thirty years of that period wheat was at 34s., shewing, that during the whole of that period, a low, and indeed a declining price, under those restrictive regulations, was constantly maintained. It was also a curious circumstance that, during the whole of the period he had mentioned, the

highest price was never more than two-thirds of that to which it rose when the system was changed to that of a free trade. . . . At the period he had mentioned (1765), a really free trade was allowed; and, at the end of eight years, the average price of grain was found to have been 21. 10s. 10d. a quarter, being 15s. 11d. higher than it had been for the long period under the formidable protection that had been granted in the time of Charles II.\*”

Lord Lauderdale proceeds to remark that the average price continued to rise, from this period, till the final exclusion of foreign grain by the enactment of the Corn Laws.

The propositions and the inference contained in this quotation are,

That during a period of ninety-five years, from 1670 to 1765, when foreign corn was excluded, the table of prices presents us with the least extensive fluctuations and the lowest prices on record:

That from the year 1765, since the establishment of a free trade in corn, and until the return to the restrictive system (we presume in 1815), fluctuations have increased in extent and frequency, and prices have continued rising:

Therefore, “That the constant admission of a foreign supply of corn is calculated, beyond all other measures, to create frequent alterations in its price, without sensibly diminishing its value.”

It has been said of natural philosophers, that to inquire with success into the secrets of nature, they must know how to interrogate her: it is not less necessary, in our researches into “the experience of past times,” that we should know how to put the question. It shall be our present endeavour to show how slenderly Lord Lauderdale is qualified to play the querist on such occasions

For the purpose of complete inquiry, we will divide the second of Lord Lauderdale's periods (that between 1765 and 1815) into two: one comprising the years 1765—1795; the other, 1795—1815. By adding a fourth (the period between 1815 and 1825), we shall include the decade of the Corn Laws.

The following table, extracted from a return to the House of Lords†, will ex-

\* *Ante*, pp. 383-4.

† Accounts stating the average price of wheat, per stat. quarter, in each year, from the passing of the act 22 Charles II. c. 13. to the present time; and the quantity of every sort of grain, flour, and meal, exported and imported in each of those years.—*Lords' Paper*, No. 100, 1826.

hibit the highest and lowest average price of wheat per statute quarter, during the successive decades of years, comprised in the four periods above mentioned.

| Ten Years, ending | Lowest Price of Wheat per Quarter. | Highest Litta. | Difference. |
|-------------------|------------------------------------|----------------|-------------|
| 1680              | 37                                 | 61             | 24          |
| 1690              | 23                                 | 41½            | 18½         |
| 1700              | 30                                 | 60½            | 30          |
| 1710              | 23                                 | 69½            | 46½         |
| 1720              | 31                                 | 48             | 17          |
| 1730              | 30½                                | 48             | 17½         |
| 1740              | 23½                                | 49             | 25½         |
| 1750              | 22                                 | 41½            | 19½         |
| 1760*             | 30                                 | 53             | 23          |
| 1775              | 40½                                | 57½            | 17          |
| 1785              | 33½                                | 52½            | 19          |
| 1795              | 39                                 | 72             | 33          |
| 1805              | 50                                 | 116            | 66          |
| 1815              | 72                                 | 122½           | 50½         |
| 1825              | 43                                 | 94             | 51          |

Of the periods thus divided, it will be observed, as Lord Lauderdale remarks, that prices were at the lowest, and fluctuations nearly at their lowest point, in the first—from 1670 to 1760.

In the second—from 1765\* to 1795—prices were considerably higher, but fluctuations less extensive.

In the third—from 1795 to 1815—prices were nearly double, and fluctuations much more than double, when compared with the second period; and,

In the fourth—the decade of the Corn Laws, from 1815 to 1825—although prices had nearly fallen to the standard of 1765-95, fluctuations had continued as in the third period of 1795-1815.

The accuracy of this statement is unimpeachable; it rests upon evidence admitted by all parties: the only question to be considered is the cause of the diversity in the rates at which prices appear to have varied during the several periods.

Before this diversity can be attributed to the restraint or freedom of the foreign Corn Trade, it is necessary to inquire into the fact of such restraint or freedom during the several periods of years.

\* We have omitted the five years between 1760 and 1765 (the last years of the period during which foreign corn was excluded by the operation of 22 Car. II.) for the purpose of dividing the whole period into decades of years. It will be seen, by inspecting the return, that the averages are not affected by this omission.

It is stated by Lord Lauderdale, that the duty imposed in 1670, by the act of Charles II., was so high as to effect a total prohibition of foreign grain for a period of more than ninety years. Lord Lauderdale undoubtedly means, that the yearly amount of imports during that period was usually insignificant, and, excepting three years (1729, 1757, 1758) was always exceeded by the exports.

This he calls a restricted trade.

We read, however, in Adam Smith, (an author with whose work Lord Lauderdale's familiarity is undoubted), that—

"The distress which in years of scarcity, the strict execution of these laws" (22 Charles II. and the subsequent acts) "might have brought upon the people, would probably have been very great. But, upon such occasions, its (their) execution was generally suspended by temporary statutes, which permitted, for a limited time, the importation of foreign corn."—"The necessity," he continues, "of these temporary statutes sufficiently demonstrates the impropriety of this general one."

By an act of 1 William and Mary, a system of bounties was established on the exportation of corn, for the purpose of preventing the home market from being overstocked in seasons of abundance. This bounty (5s. per quarter on wheat) was so effective, that it sometimes cost the public in one year more than three hundred thousand pounds†.

By the proper application of this machinery, it would be found (if it were worth while, on this occasion, to detail the results of a minute historical inquiry) that the tendency to fluctuation was checked with as much effect as it probably can be under the existence of a prohibitory system.

In the first place, the tendency to a fall in price, in years of plenty, was checked by a heavy bounty on exportation. In the next, the tendency to a rise, in years of scarcity, was counteracted by a temporary repeal of the importation duties, and by substituting a prohibition, instead of the usual bounties, on the exportation of grain. The censure bestowed on this system by Adam Smith is undoubtedly just; but it cannot be denied, that a uniform adherence to the statutes of Charles II. and William and

\* *Wealth of Nations*, book iv. chap. 3.

† *Ibid*, loc. cit.

Many would have produced more extensive fluctuations, and more disastrous effects\*.

Thus much for Lord Lauderdale's long period of "a restricted trade."

The second period, that of 1765-95, was ushered in by the establishment of a new system, "in many respects better than the ancient one, but in one or two respects perhaps not quite so good†." By the statute 13 Geo. III. (1773) the high duties upon importation were taken off so soon as the price of wheat rose to 44s. the quarter; and at 48s. the quarter, wheat was admitted at a nominal duty of sixpence: the old bounty of five shillings the quarter upon exportation ceased, so soon as the price rose to 44s. instead of 48s., the price at which it ceased under the former act. It appears, on examining the return from which the preceding table is constructed, that, with a few exceptions in the earlier years of this period, importation, either at the nominal duty, or, at most, a duty of 2s. 6d. the quarter, was not obstructed by this law till its cessation in 1815.

This interval, therefore, presents us with the only period of a tolerably free trade in the history of the Corn Laws. As far as we can rely on the accuracy of figures, (and few things are so little precise with so much parade of accuracy,) the inference from the tabular statement is important. Counting the years by tens in the construction of the table, we were obliged to include in this decade the year 1795, for which the highest price is stated at 72s. This year more properly belongs to the third period: in this year, those causes had begun to operate which finally produced the great demand for raw pro-

duce, and the consequent high prices by which the subsequent period was distinguished. If the year 1795 be omitted, the table will present us with the following scale of price and fluctuation:—

| Ten Years ending | Lowest Price of Wheat per Quarter. | Highest Ditto. | Difference. |
|------------------|------------------------------------|----------------|-------------|
| 1775             | 40½                                | 57½            | 17          |
| 1785             | 33½                                | 52½            | 19          |
| 1794             | 39                                 | 53             | 13          |

An examination of this table will convince us, that this is incomparably the steadiest series of prices, from the year 1670 to the present day; and being distinguished by the nearest approach to a free trade, it affords a singular presumption of the inaccuracy of Lord Lauderdale's inference as to the effect of free trade in extending the range of prices.

With respect to legislative measures, the third period, from 1795 to 1815, approached as nearly to a system of free trade as that of 1765-95. But that interruption to the free commerce in grain, which was not inflicted by the hand of "the great domestic enemy\*," was produced by as powerful a foe from without; and a monopoly, not yet the gift of their own hands, though scarcely less complete, was bestowed on the British landlords by the policy of the external enemy. The capital and population of the country had long required a greater supply than was demanded in the first half of the last century. Prices had exhibited a tendency to a permanent rise during its latter half, and the war came upon us when national wealth was increasing in a geometrical ratio, accompanied by a proportionate increase in the demand for grain. Shortly after its commencement, the war assumed that feature of malignant hostility to commercial intercourse, which, when carried to its acme, was as effectual a bar to importation at moderate prices as a parliamentary vote. The following table of the charges, for freight and insurance in 1809, as compared with 1822, presents a striking instance of the prohi-

\* Thus, in 1699 (10 Will. III. c. 3) the exportation of corn was prohibited for a year. The bounties were suspended from February 9, 1699, to September 29, 1700, by 11 Will. III. c. 1. In 1709 (8 Anne, c. 2), exportation was prohibited before September 29, 1710, with power to the Queen to permit exportation sooner. In 1741 (14 Geo. II. c. 2), exportation was prohibited before December 25, 1741. In 1757 (30 Geo. II. c. 1, and subsequent acts), exportation was prohibited, and the duties on importation were removed, till December 24, 1759. — For many instances of similar legislation, see a useful pamphlet, called "A Compendium of the Laws passed from time to time, for regulating and restricting the Importation, Exportation, and Consumption of Foreign Corn," &c. — London: Ridgway, 1826.

† Wealth of Nations, *loc. cit.*

\* Lord King:—*ante*, p. 385.

bitory character of the war\*. The rates of freight, and the premium of insurance, from St. Petersburg to London, in these years, were—

In 1809, on Hemp, 30l. per ton.  
on Tallow, 20l. do.  
on Linseed, 45s. per quarter.

In 1822, on Hemp, 3l. per ton.  
on Tallow, 2l. do.  
on Linseed, 4s. 6d. per quarter.

The fluctuations in the price of grain, during this period, were beyond all former example; they, nevertheless, fell short of the fluctuation in the following period of ten years, during the operation of the Corn Laws,—a fluctuation of more than cent per cent.

The result of this investigation may be expressed in a few words. In proportion to the freedom with which foreign supplies have been admitted, the range of prices has been contracted:—a conclusion so repugnant to that which Lord Lauderdale has drawn from the same sources, that it would affect us with vehement surprise, had we not learned from experience that there are no facts so stubborn which will not take any bent, when viewed through the medium of a man's peculiar interest.

We have not, however, by this conclusion, decided all the objections to a free trade in corn, on the score of its tendency to augment the variation of prices. Mr. Whinnore, in summing up the objections of the landed interest to such a trade, observed, (and we quote the observation, instead of picking up the scattered remarks from the little speeches of the country gentlemen) that—

"It was said, that if the ports were opened, we should be deluged with foreign grain at one time, and half-fed through scarcity at another—that agriculture in this country would be ruined—that we should be totally dependent upon foreigners for support: and that those foreigners would create artificial scarcities in time of peace, and afford no grain for subsistence in time of war."

It is true, we are told by Lord Lauderdale, in that rare spirit of consistency which distinguishes the opinions of these practical philosophers from the reasonings of the political economists, that—

The most mischievous principle that can be adopted by this country was, to rely on fo-

\* Tooke's High and Low Prices, p. 211. Second edition.

† *Ante*, p. 329.

reigners for a supply of grain. If it were true, that when the crop was small in one part of Europe, it was sure to be great in another, then there would be some certainty about the matter. But the fact was not so. If they looked to the corn-trade throughout Europe, they would find that, when there was a bad season here, there was also a bad season on the Continent, especially in the north of Europe, whence the great supply was to come. *Therefore, they would be inundated with corn in a year of plenty, but in a year of scarcity they would not be able to procure the requisite supply.* The law of nature was opposed to such a system; but, independent of that, it would be affected by municipal laws. If they examined the law of France, the law of Sweden, and the law of other countries, on this subject, they would find that provision was made to prevent corn from being exported when it was at a certain price\*.

On this occasion, however, Lord Lauderdale has differed from his brethren at the expense of the whole argument. It is enough to observe, that if importation can only take place in years of domestic plenty—whether from "the law of nature," or of princes it can never take place at all. It will not take place in years of scarcity,—because, says Lord Lauderdale, the scarcity being general, the rise in prices will be general; and we cannot import unless our prices exceed those abroad. The facts being granted, we shall not dispute the inference; we shall only give it its due extension. Importation, then, will not occur in years of plenty, because the plenty being general, the fall in prices will be general, and we cannot import unless our prices exceed those abroad. So long as we proceed on the supposition, that the alternations of the seasons correspond in all parts of the world, (a supposition which has no other defect, than that of being contrary to universal experience,) so long must we admit that the fluctuations of price will correspond; and, on such a theory, unless we can import at all times, it is plain that we can import at none. That theory, however, should allay the anxiety of Lord Lauderdale with respect to the consequences of free trade: in his view of the facts, the proof of the inutility of a free trade is no doubt abundant; abundant also is the proof of the inutility of a restricted one: and were it merely to silence clamour and dispel delusion, the landlords could but gain, by flinging their obnoxious and unprofitable protection to the winds.

It is, however, a more interesting in-

\* *Ante*, p. 383.

quiry, to ascertain the probability of that "deluge of foreign grain" with which the advocates of free trade are threatened by the zealots for monopoly.

The countries which, in the event of a free trade, would furnish us with supplies of grain, would regulate those supplies (for a considerable time) by the extent to which the manufactured goods they now obtain from other quarters, or produce at home, could be advantageously imported from Great Britain. The present surplus of raw produce, which they annually exchange for foreign imports, is all they can now command for the purpose of exportation. All they could command, in any case, by abandoning their present manufactures, and importing them from abroad, would consist of their present surplus, and the additional quantity which the capital released from manufacture would produce, if applied to tillage. We do not speak of the surplus which might be produced hereafter by the accumulation of capital, and the growth of those institutions which favour the increase of wealth. The object of our inquiries with respect to this question, is the surplus which can be brought into the market *speedily*. Unless a large quantity can be poured at once into the market, to speak of a *deluge* of foreign corn is a mere "insignificant rhetoric."

It is also unnecessary to inquire, with relation to this point, as to the actual accumulations which may exist in the foreign granaries at the period of opening the ports; the influx of such accumulations would, of course, be checked by proper provisions in the law.

To estimate the surplus which may possibly be sent into the British market from foreign countries, we must first ascertain the surplus which they now export in exchange for foreign manufactures, and the amount of capital which may probably be turned from other branches of production in those countries to the production of raw produce. It is evident that these circumstances admit of no accurate estimation; but exactness, even if within our reach, would be little more conducive to use, than the approximations which our actual knowledge will enable us to attain.

During the first twenty-five years of the present century, we have drawn our supplies of every species of grain from foreign countries in the following proportions:—

|                                      |     |
|--------------------------------------|-----|
| From Russia, Poland, and Prussia,    |     |
| with an insignificant portion from   |     |
| Sweden, Norway, and Denmark . . .    | 11½ |
| From Germany and the Netherlands . . | 8   |
| From France and the South of Eu-     |     |
| rope . . . . .                       | 1   |
| From North America . . . . .         | 2½  |

It appears, therefore, that nearly one-half of our supply has been hitherto drawn from the nations of the north of Europe.

With respect to the circumstances above described as indicating the *power of supply* in foreign countries, we have, as far as the northern countries are concerned, the highly probable evidence of Mr. Jacob.

The first country described in Mr. Jacob's Report is Prussia. Of the manufacture of that country he observes, that—"those Prussian provinces to which my chief attention was directed, have never been manufacturing districts, although they have, during a long series of years, made both linen and woollen cloths for their own use. They have had rather domestic labour, than any establishment for the purpose: of late, however, attempts have commenced upon a larger scale, and projects were in agitation of various kinds, for making woollens and cottons in manufactories where the aid of machinery was to be applied. The chief inducement to those attempts was the low price of provisions, and the consequent expectation of a low rate of labour. They were, however, but attempts, and were not viewed with any very promising expectations by the persons I had any opportunity of conversing with on the subject. They seem to be rather the creations of the Government, than the spontaneous issue of the deliberate calculations of capitalists, seeking for beneficial modes of employing their money\*."

Of the limited demand for those products of manufacturing industry, which require the employment of large capitals, the following description of the state of the labouring population—comprising, in that country, the immense majority of the consumers—will afford an adequate conception. Speaking of this class, Mr. Jacob says, that—"If disposed to labour beyond the time required for their own land, there is a difficulty in obtaining employment, and in the winter months, which are

\* Jacob's Report, pp. 22-3.

" long and severely cold, no agricultural work can be performed. The flax and the wool spun in their cottages must supply the clothing of the family; and the fat of the animals they kill must be converted into soap and candles. Meat of any kind can be rarely afforded to be eaten by such families; and only the few that are more prosperous than their neighbours can keep a cow to supply them with milk. They consume nearly all they produce, and are considered happy if they have a sufficient surplus for sale to meet the demand of a few shillings annually for the payment of their trifling taxes and local assessments\*."

" This large description of the inhabitants live in dwellings provided with few conveniences, on the lowest and coarsest food; potatoes or rye, or buck wheat, are their chief, and frequently their only food; linen, from flax of their own growth; and wool, spun by their own hands, both coarse, and both worn as long as they will hold together, furnish their dress; whilst an earthen pot, that will bear fire, forms one of the most valuable articles of their furniture†."

The same remarks, almost in the same words, are equally descriptive of the manufactures, and the demand for manufactured articles in Poland. The paltry manufacture of coarse cloth for the Russian market, where that article finds purchasers from the high duties imposed on the products of English and German industry,—and the few establishments for making linens, cotton, iron wares, and paper for home consumption, appear chiefly to subsist by the aid of capitals advanced by Government. Of the peasantry it is observed, that they live in wooden huts, covered with thatch or shingles, consisting of one room, with a stove, around which the inhabitants and their cattle crowd together, and where the most disgusting kinds of filthiness are to be seen. Their common food is cabbage, potatoes, sometimes, but not generally, pease, black bread, and soup, or rather gruel, without the addition of either butter or meat. Their chief drink is water, or the cheap whiskey of the country,

" which is the only luxury of the peasants, and is drunk, whenever they can obtain it, in enormous quantities. . . . In their houses they have little that merits the name of furniture; and their clothing is coarse, ragged, and filthy, even to disgust\*."

To complete the description of these countries, with reference to our present purpose, it is only necessary to place before the reader the following account of the operations of agriculture:—" In general, the soil of the maritime provinces of Prussia is so light, that it may be easily ploughed with two oxen, and those of diminished size, and no great strength. I have not unfrequently seen, on the smaller portions of land, a single cow drawing the plough; and whilst the plough was guided by the owner, the cow was led by his wife. . . . The various implements of husbandry are quite of as low a description as the working cattle. The ploughs are ill constructed, with very little iron in them. The harrows are made of wood, without any iron even for the tines, or teeth. The waggons are mere planks, laid on the frame loose, and resting against upright stakes, fixed into the sides. The cattle are attached to these implements by ropes, without leather in any part of the harness. The use of the roller is scarcely known; and the clods, in preparing the fallow ground, are commonly broken to pieces by hand, with wooden mallets. In sowing, the seed is carried in the apron, or the skirts of the frock of the man, who scatters it on the ground†."

These extracts are decisive. Countries in this state of poverty can possess nothing worthy the name of capital, when contrasted with capitals in England, which could be diverted from manufactures to the soil: their demand for foreign manufactures must be of the most diminutive amount; and by abandoning their commerce with the countries from which (if such a commerce exist) they are at present supplied with wrought commodities, they would confer but little favour on our own manufacturers, and send but little corn into our markets. It may also be remarked, that if the protection afforded by the Government to the Polish manufactures be the result, not of the exclu-

\* Jacob's Report, p. 19.

† *Ibid*, p. 21.

\* Jacob's Report, p. 27.

† *Ibid*, p. 20.

our raw produce from the British, and of the sapient policy adopted with energy by the United States, in the prohibition of making Poland market for herself—there is an end to our fear of importing a single bushel of her raw produce. How absurd, to suppose that the supplies from Prussia would be poured into our market, as the flood anticipated! How unreasonable, with Mr. Baring, that the foreign merchants would not in the first year of a free trade, enter the English market, nevertheless the foreign growers put their heads above ground next year—and in the power of supplying this country he from Mr. Jacob—knowing that he could not do without them, would take care that there should be a abundant supply \*.”

Foreign grower can put in no more than his implements will enable him to do, and how “the knowledge that he cannot do without them” will be the number of Polish ploughs, good for Polish serfs, is far from a prudent proposition.

then, as credit can attach to the produce before us, it appears that any supply from the northern countries is impossible, till the accumulation of capital shall enable the Polish and Prussian farmers to produce a more abundant supply. This being ascertained, the question of the prices at which they export their surplus, becomes of less importance than has been attached to it. It is, however, the permanent price of English corn at about 50s. the quarter, the estimates of Mr. Jacob, seem to be somewhat over-rated, and tend to shew that, so far from apprehension of “a deluge,” a duty of so great magnitude—a duty even in a small degree, what is to counterbalance the taxes on corn in England—would amount to a total prohibition. In his “attempts to calculate the cost of wheat to Prussia,” in the north of Europe, he candidly admits the difficulty of the task, and the necessary uncertainty of the results. The reader, therefore, will excuse his own discretion in adopting the following estimates of the probable

prices of importation from Prussia and Poland :—

|                                                             | s. | d. |
|-------------------------------------------------------------|----|----|
| Total cost price of wheat per quarter in Prussia .....      | 31 | 0  |
| Shipping charge, and merchant's commission, or profit ..... | 2  | 9  |
| Freight, primage, and insurance to London .....             |    | 80 |
| Lighterage, landing charge, and commission in England ..... | 1  | 3  |

Price in the English market . . . . 43 0

By similar calculations, the export price of Polish corn is rated at 48s. and 45s. 6d. the quarter (shipped from Dantzic), as estimated upon the average prices for ten years, at Warsaw and Cracow \*.

Great stress has been laid by some on the supplies we may derive from the Black Sea. On this subject we shall cite the remarks of Mr. Whitmore :—

“There can be no doubt of the large exports which take place every year from that quarter—larger, perhaps, than those which are drawn from the Baltic. I have great doubts of any considerable portion of that corn finding its way to the English market. My reasons for these doubts are as follow :—the Black Sea is in the immediate vicinity of countries regularly importing corn; Constantinople, Malta, the Grecian Archipelago. Some parts of Italy and Spain draw their foreign supplies from thence, and commonly exhaust its stores; and it appears, by a return presented to parliament last year, that from the 5th of January 1817, when the imports from the Black Sea were first distinguished in the accounts kept at the Custom House, up to 1826, only 50,155 quarters of wheat have been imported into this country from thence; the year of largest import is 1819, when it amounted to 20,685 quarters. The distance is so great, that the expense and risk attending such an import are great impediments to its becoming an extensive traffic; and I have been assured by a merchant of great eminence, thoroughly acquainted with the Corn Trade, that the wheat hitherto sent from thence has been of a description known in commerce by the designation

\* *Ante*, p. 364.

\* Jacob's Report, pp. 24-29-40

"nation of sour flour, and utterly unfit for the purpose of food\*."

With respect to Germany and the Netherlands, we have no specific evidence. In the first place, it does not appear in what proportion the imports from those countries consisted of native produce: in the next, we have no statistical account of the state of their farming and manufactures. We know, however, that those parts of the Continent have experienced a great fall in the price of agricultural produce, and of course a considerable loss of agricultural capital: we know, too, that their manufactures are extensive, and not likely to be supplanted by our own. We may, therefore, conclude that their exports of native grain would not increase in the fearful ratio which the fears of the landholders suggest.

The other countries from which corn may be imported into Great Britain, are France, and the states and colonies of North America. The countries bordering on the Mediterranean, some of which were once the granaries of the world, are reduced by bad government to a condition even worse than that of the north of Europe; their produce is scarcely sufficient to keep off the approaches of famine. Considering the mania for protection which prevails in the councils of France—their determination to manufacture for themselves—their corn laws—their increasing wealth and population—and the actual price of wheat, which costs to the grower, on an average, not less than 6s. the bushel†, there seems no probability of our deriving any copious supplies from that quarter; and, although all these causes are not in operation in Canada and the United States, the anti-commercial tariff of the North American government would for some time present a serious obstacle to an extensive exportation of grain‡.

It seems, therefore, from this rapid review of the evidence in our possession, that the anticipations of a speedy and extensive fall in the price of corn from the amount of foreign supplies, are altogether destitute of foundation. The shortness of our sketch has prevented us from

examining the evidence with that minuteness which it may seem to require; but, independently of our limited space, we may observe, in justification of our brevity, that the same evidence has been repeatedly submitted to criticism, and always with similar results.

The same causes which would prevent an immediate deluge of foreign grain,—namely, the impossibility of exporting that which has no existence—would prevent a deluge at any future period, after the establishment of a free commercial intercourse. It is only necessary to remember, that the ordinary surplus required by this country would be all that, one year with another, would be produced abroad: from such a surplus no deluge could occur: that a greater than the common surplus could be suddenly brought into the market, we have already attempted to disprove.

In confirmation of these remarks, we shall adduce an example which affords an apt illustration of the gradual rate at which the exports of raw produce advance, even under circumstances highly favourable, in comparison with those of the northern countries, to the accumulation of stock. We mean the example of Ireland. The imports of all sorts of grain from that country, beginning in 1802, have increased in the following proportion:—

| Years.     | Quarters. |
|------------|-----------|
| 1802 ..... | 467,067   |
| 1803 ..... | 343,548   |
| 1804 ..... | 316,958   |
| 1805 ..... | 306,923   |
| 1806 ..... | 466,947*  |
| 1807 ..... | 463,406   |
| 1808 ..... | 656,770   |
| 1809 ..... | 933,558   |
| 1810 ..... | 632,849   |
| 1811 ..... | 430,189   |
| 1812 ..... | 600,268   |
| 1813 ..... | 977,164   |
| 1814 ..... | 812,805   |
| 1815 ..... | 821,192   |
| 1816 ..... | 873,865   |
| 1817 ..... | 699,809   |
| 1818 ..... | 1,207,851 |
| 1819 ..... | 967,861   |
| 1820 ..... | 1,417,120 |
| 1821 ..... | 1,822,816 |

\* Letter to the Electors of Bridgenorth, p. 75.

† Jacob's Report, p. 47; and Return from the Consuls of the Prices of Foreign Corn, for 1825.

‡ See Return from the Consuls, &c.

\* By 46 Geo. III. c. 97 (1806), the free interchange of every species of grain was allowed between Great Britain and Ireland, subject only to the regulations attaching to goods removed coastways.

|            |           |
|------------|-----------|
| 1822 ..... | 1,063,089 |
| 1823 ..... | 1,528,153 |
| 1824 ..... | 1,634,024 |
| 1825 ..... | 2,203,962 |

This table proves the impossibility of extensive and sudden importations, either at the commencement, or during the course of a free trade: it also proves, what we shall now discuss in a few words, the permanent tendency of such a trade ultimately, and by degrees, to augment the amount of importations.

In our endeavour to dispel the apprehension of excessive importations, we must not be understood to countenance the strange doctrine which some opponents of the Corn Laws have put forth, in order to reconcile the landed interest to a free trade,—a doctrine which, by proving that foreign corn could never be imported into Great Britain at a less cost than it can be grown there,—that is, that it could never be imported at all—unhappily proves, at the same time, that the Corn Laws have no real operation either for good or evil. We were certainly not prepared to find in Mr. Whitmore's pamphlet (which is only an authoritative version of his speech in the last session of Parliament, and which we therefore quote in preference to the speech itself) so singular an oversight as this:—

"It remains now to be seen what effect would be produced on our agriculture by the renewal of the trade in foreign corn; and the inquiry is the more necessary, as, upon this as upon other parts of the subject, great exaggerations have prevailed. Both friends and foes of the Corn Law unite in one common opinion,—namely, that the admission of foreign corn will have the effect of driving the poor land out of cultivation; and they have thus raised an alarm in the minds of the agriculturists, which creates the most serious difficulties to those who advocate an alteration of the law. Nor is it to be wondered at; for if that were indeed the effect to be produced, the misery and desolation it would create throughout the country would be such, that, deeply as I am convinced of the necessity of a change in the law, I own my zeal would be considerably abated by so dismal a prospect. My opinion, however, is, that no such effect would be produced. I do not believe a single acre, now cultivated with profit, would cease to be cultivated after the alteration of the law. My reasons on which this persuasion is founded are these:—In the first place, although the average price of the last three or four years exhibits a great fall, as compared with that which existed between 1810 and 1820, the latter being 87s. 10d., and the former under 60s., I am not aware of any quantity of poor land having been thereby

thrown out of cultivation. I have neither seen nor heard of it; and being myself an occupier as well as a proprietor of poor land, I can take upon me to assert, that if, in some partial instances, such an effect has been produced, it at least has been any thing but extensive. The effect which has been produced, I believe to be this, that very expensive manures have not been purchased so largely, and spread with so prodigal a hand upon the land; that draining and other expensive improvements have been carried on with less rapidity, and that clover leys have in some instances been allowed to lie down for a longer period than heretofore\*."

It is impossible for any person, so well acquainted with this question as Mr. Whitmore, not to find, on mature reflection, two capital fallacies in this passage. If no poor land should cease to be cultivated, or what is, in fact, the same thing, should be cultivated with a smaller capital, the institution of a free trade in corn would be next to useless. For what is the end of a free trade? Is it not to secure a constant supply of foreign corn? Without a constant supply, it is impossible to obtain the advantages held out as an inducement to such a trade,—the advantages of procuring cheaper corn, and, by extending the field of production, of contracting within their narrowest limits the fluctuations incidental to the Corn Trade. But how can a foreign supply find its way into the British markets, so long as they are engrossed by the present quantity of British produce? How can it ever make its way, but by supplanting an equal proportion of British produce? How can it supplant that produce, but by underselling it, and rendering the cultivation of the poorer soils less profitable than the importation of grain—less profitable than any other mode of employing capital? And, finally, how can those soils be cultivated, for any considerable period, at a lower rate of profit than is yielded by all other employments? It seems, however, that Mr. Whitmore is misled by a partial observation of facts. Admirable is the remark of Dr. Cullen,—a remark of which the applicability is not confined to the art of medicine,—that "there are more false facts in the world than false theories;" and few facts are so false as this. Mr. Whitmore says, that no poor land has been withdrawn from cultivation since 1810, notwithstanding

\* Whitmore's Letter to the Electors of Bridge-north, p. 79.

the difference of prices. It is certain that Mr. Whitmore should be competent to make the proper observation as to the fact, being himself an owner of poor land. If, however, none of his poor land has been thrown out of cultivation, how does Mr. Whitmore account for the diminution of his rent-roll? No doubt from the simple circumstance that the "very expensive manures," above mentioned, "have not been purchased so largely, and spread with so prodigal a hand upon the land;"—no doubt from the more niggardly use of "draining" and other expensive improvements;"—no doubt, from the greater age to which the "clover leys" above spoken of have lately been permitted to attain;—in short, from the subtraction of capital from the soil: and in what respect the subtraction of capital is different in its effects on the extent of agricultural employments, from the abandonment of inferior soils—in what respect it can be more palatable to the landed interest—we leave to be explained by Mr. Whitmore, who has so ably shewn, in another work, that their effects are one and the same\*.

Undoubtedly a free trade in corn would be followed by a permanent fall in the price of agricultural produce. We have given what we consider highly probable reasons for believing that the fall would not be great: but the greatness of the fall is not the material point. What is material, is the establishment of a regular importation—a system by which the comparative abundance of other countries may at all times be at hand to relieve any scarcity in our own, and thereby prevent the excessive range of prices to which a narrow field of cultivation is obnoxious. It is also most probable, that, however small the supply we might at first be able to derive from foreign countries, it would gradually and constantly increase. The gradual accumulation of capital, in the exporting countries, would enable them to send us yearly a larger quantity at a cheaper rate, and year after year would the bad soils of England be abandoned, till the cost of producing grain abroad had reached its minimum. At that point, the greatest security would be attained against fluctuations in price which

can be accomplished by the intervention of man; and we should then be exposed to the mutability of the seasons only. What, therefore, it is desirable to effect, is the gradual abandonment of the bad soils: or what is the same thing, the abandonment of the expensive culture to which they are now subjected, and by which corn is raised in price to that excessive rate, which renders every casual abundance the cause of enormous variations. "It is well known in England," says Mr. Jacob, "that under a great depression of the price of corn, the poorer lands suffer a much greater proportionate depreciation in their sale price than the more fertile soils\*:" and Mr. Whitmore has remarked, as an irresistible argument in favour of a free trade in corn, that "the fall of price from 80s. per quarter to 40s. is a very different thing from the fall from 60s. to 40s.†;" in other words, the fluctuations when the price of corn is raised by expensive tillage—by the cultivation of inferior land—are very different from those which occur when moderate prices are secured by the tillage of good land and moderate cost of production.

The result of this inquiry shews that the common opinion, with respect to the influence of free trade in equalizing the prices of corn, is unshaken by the arguments we have just analysed. It derives, indeed, additional strength from the exposure successively inflicted on every argument produced against it.

#### 9. *Utility of the Corn Laws in rescuing us from a dependency on foreign nations for a supply of grain.*

Anxious as we are to omit no fallacy on this subject, but circumscribed to the exposure of those which are advanced in the parliamentary debates, we have been able to add but one more to the present class—to the class of patriotic fallacies.

"A free trade in corn," it is said, "would reduce us to a dependence on foreign countries for our supplies of the first necessities of life."

This opinion, which is daily re-iterated in every variety of phrase, has seldom been expressed with more artfulness than in the following characteristic passage:

\* See Mr. Whitmore's "Letter on the Present State and Future Prospects of Agriculture," &c. (1823).

† Jacob's Report, p. 14.  
+ Letter to the Electors of Bridgwater, p. 19.

Speaking of the Corn Bills of last session, Lord Ellenborough is reported to have used the following language:—

“He begged their lordships to recollect that what was innovation one year became precedent next year, and rule the next. (Fallacy—*dread of innovation*). If the present measures should be agreed to, the result would be, that we must always admit bonded corn. (Fallacy of *distrust—always because once*). He thought the landed interests deserved every encouragement consistent with the general interest of the country. (Truism). He objected to an extensive foreign trade in corn—he desired never to see our granaries placed in the hands of those who were jealous of our national greatness (hear, hear).”

For other, but less expressive versions of this sophism, let the reader turn to any page of the debates, or any speech at any county meeting or agricultural club.

We deny it, however, in spite of the pertinacity with which it is daily spread abroad, for reasons which have been frequently stated and never answered; but which, as they are either unknown or suppressed by those who utter the fallacy in parliament, must be repeated till they are made known and acknowledged, or refuted. In our humble speculations, we have no hankering after the praise of originality: more especially in speculations like the present, in which so little that is original can be said: we are content (if that merit shall be conceded) to be useful.

We may certainly suppose a case, without exceeding the limits of possibility—although it has never happened; and, so long as we judge from the immense preponderance of probabilities, never will happen—in which a dependence on foreign countries for an annual supply of grain would reduce us to a state of starvation. Absurd as the supposition will appear, we must in candour make it. It is that of a simultaneous embargo on the exportation of the usual supply of corn to Great Britain from every port of extensive export in the four quarters of the globe. On any other supposition—on any supposition that deserves a moment's attention—the argument is egregiously false.

An embargo of this nature might originate, and could only originate in a combination of the major part of the governments of the exporting countries. To ascertain the probability of this event,

it is only necessary to ascertain the interests of a majority of those governments with respect to such a combination.

The interest of a government is the interest of the predominant class: the predominant class, in most of the countries from which our imports of corn would be derived, is the class of landowners. It is plainly the interest of that class to extract the greatest possible revenue from their property; in other words, to sell their corn to the highest bidders. Deviations from this principle may occur; but, like other particular exceptions, they do not shake the general rule. It is plainly, therefore, the interest of those by whom the majority of the exporting countries are governed, that exportation should always take place so long as the foreign is higher than the home market. But the very existence of a constant trade between this country and any country exporting corn, supposes that the British market is higher than the home market: exportation would otherwise cease. It supposes that British goods may be had in greater abundance for a smaller quantity of corn than goods of domestic manufacture.

Such being the interests of the respective governments of those countries which supply us with corn, upon what principle of human nature, or by what example in history, can it be believed that any number of those governments would combine to inflict an evil on this country at the expense of a greater evil to themselves, “out of jealousy of our national greatness?” Alliances between ambitious governments—and ambition is the only principle which could call forth a combination of this kind—even for purposes more congenial with their several interests, are by no means stable, or effective. The Holy Alliance itself—an alliance of all the purer aristocracies against every people, for the preservation of all that is most dear to those aristocracies, the preservation of their power—already totters from intestine discord. If a union so beneficial, that nothing but the most stupid selfishness on the part of the several confederates can account for its dissolution, have failed, how can it be believed that the same parties would combine efficiently to humble a single nation?

But what, it may be asked, if a current scarcity in the corn-growing countries should produce the same effect with

respect to England as a hostile combination of their governments? Admitting that this event will not occur from motives of political enmity, may it not be, at times, adopted for reasons of domestic policy; as the means of subduing discontent or averting famine?

Convinced that "like antecedents are followed by like consequents," we do not fear to answer in the negative. Once more, what is the interest of the land-owners? Not that the price of corn should be low, but that it should be high. But if it be their interest, in years of plenty, to exchange their grain for British goods, it can be no less so in years of scarcity. A rise in the price of corn would not alter the relative proportion between British and domestic goods: whatever might be the price of corn, it would still be the interest of the foreign growers to exchange it for British manufactures; and as, in the majority of instances, the grower of corn is the ruler of the country, the exchange would of course take place.

Nay, more,—it is not only the interest of the land-owner; it is no less the interest of the people, that the Corn Trade should remain unshackled in times of scarcity. During the late famine in Ireland, it was a frequent topic of popular declamation, that whilst the people were perishing for want of food, there were daily exportations from that country to England. This language, however expressive of sympathy with the sufferers, evinced but little knowledge of the causes to which the suffering was really owing. That part of the exported produce which was not exchanged for the superfluities of life, for what was it exchanged? For those articles of English production which were necessary to enable the Irish capitalist to persevere in employing his capital in its usual extent. If those articles had been wanting—if, instead of procuring them, the food by which they were purchased had been distributed amongst the people at a price artificially depressed, by prohibiting its exportation, the consequence must have been a contraction of the capital of the country. A contraction of the national capital would have been followed by a decrease in the production of the next and all subsequent years; and thus a measure adopted to mitigate a present famine—and that only in a very limited degree—would

have given rise to a succession of famines for years to come.

From neither of these circumstances, therefore, does it seem probable that our supplies could be endangered. Let us examine a third case—the case of a continental war.

The only war which could produce the effect of a general embargo, would be a war between England and all Europe. This has happened once: it is not likely to happen again; but the examination of what occurred on that single occasion, will suffice to shew what would occur hereafter, in the event of a similar conflict.

To raise the price of corn *by degrees*, and so to impose upon this country a burden like that with which she is now loaded by her own Government—the burden of the Corn Laws:—such was the result of the late war between the Continent and Great Britain.

By a series of extraordinary conquests, a gigantic enemy may succeed in checking, to a great extent, the exportation of corn throughout Europe: but what, in the meantime, must be the consequence at home? The demand for corn continuing, and the supply decreasing, prices will rise, and more capital will be gradually spent upon the soil; hence, with the diminution of external supply, our internal resources will increase, and fill up the void. To this it may be answered, that a long period of free trade in corn may produce too great a population to be fed by the resources of the country: that, in such a case, war is starvation, and we are wholly at the mercy of our enemies\*. To obviate such an occurrence, it may be said, it is better, by a timely restraint on the importation of grain, to prevent a population from growing up whose necessities shall exceed the power of the country to supply them.

\* It has been said by Mr. Whitmore and Lord Liverpool, that the produce of this country is *not sufficient* to meet its consumption. The phrase is ambiguous, and admits of several explanations. But supposing it to mean—and supposing it to be true—that a sufficiency for the wants of the population can no longer be obtained from the soil—the question as to the utility of a foreign trade is put at rest for ever. Come what will, we must continue to import, or starve—an alternative, if we may use the solecism, in which there is no choice.—For Mr. Whitmore's remarks on this point, see *ante*, p. 351. See also Col. Wood's reply, *same page*. For Lord Liverpool's observations, see *ante*, p. 373, and again, p. 384.

To this argument we propose the following reply.—We admit that, under a combination of extraordinary circumstances, like those which occurred in the last war—a combination to which the history of Europe affords no parallel example in time past, and will scarcely afford another, speedily, in time to come—the power of a colossal despotism may render commerce so dangerous as to raise the price of foreign grain, by a succession of arbitrary decrees, to the exorbitant prices experienced during the late war with Europe. And it can do no more. There is no punishment so atrocious, which will not be as fearlessly braved, for the sake of an adequate reward. The difficulties with which the brutal arm of power may interrupt the channel of commerce, may add much to the price of a prohibited commodity; but when that has attained a certain height, the smuggler—the champion of civilization in the last resort—steps in: encouraged by public approbation, and impelled by private gain, he defies the penalty which awaits detection, and mitigates, by a useful violation of law, the enormous evils of so detestable a policy. Of this we have a singular proof in the events of the last war.

"It should be remembered," says Mr. Dooke, "that when the power of the great enemy on the continent—and such an enemy we were not likely to meet again—was at its height; when his decrees against all commercial intercourse with this country were sought to be enforced with the utmost severity, we found little difficulty in procuring a supply of corn, as well as of hemp and timber. It was a fact, that in the year 1810, when there were apprehensions of a scarcity, we imported 1,500,000 quarters of corn, more than we had ever before imported in one year; and this, let it be recollected, when the restrictive laws of a powerful enemy were at their height. What was singular in this circumstance was, that the greatest part of those importations were from the ports of France and the Netherlands—countries which were most under our enemy's control. They would have starved us, if they had not found that the supply which we wanted would be a source of profit to themselves\*."

Such is the natural remedy for the excesses of military ambition, when directed to the suppression of trade.—There is, however, one aspect under which this question may be viewed, and in which it is never viewed in parliament; an aspect

perhaps the most important, not only of this, but of all other measures of free trade; namely, their tendency to diminish the chances of war, by converting our national enemies into fast friends; by removing their "jealousy of our greatness;" by making our greatness as much their interest as our own. To this happy consummation nothing could more directly lead than an unrestricted intercourse in the necessaries of life. When the principal countries of Europe shall have become mutually dependent on each other for a great portion of their raw produce and manufactures, we may expect a speedy termination of the barbarous wars which are the scourge of humanity, and which, whilst they last, must repress all effectual improvement in the condition of the mass of mankind.

II. Such are the proposed reasons against innovating in the system of the Corn Laws. If the replies which we have made should seem sufficient, how, it will be asked, shall we account for the pertinacious adherence to a system for which the reasons are so plainly inadequate?

Speaking of the Corn Laws of his own time, which, bad as they were, cannot be compared to those of 1815 and 1822, without injustice, this is the remark of Adam Smith: "Nothing seems necessary for the repeal of such regulations, but to convince the public of the futility of that system, in consequence of which they have been established."

Of the futility of these laws, the public, that is to say, that portion of the public who reflect upon the corn tax as well as pay it, have long since been sufficiently convinced; and if the public were the law-makers, the repeal would have been long since effected. On this subject, however, to use the plain language of Lord Milton—plain language describing plainer facts—the public "are placed at the mercy of the landlords, and the legislature are composed of those landlords. The landlords form a body of men, not numerous, but powerful. They are the members of parliament, and those who make the members of parliament\*"—and those, therefore, to whom it belongs to enact, amend, and repeal. To convince this body of legislators "of the futility

\* Speech at the City of London Tavern, April 18th, 1825.—(*Times*.)

\* *Ante*, p. 335.

"of that system," is a far more difficult task. To convince them of its futility with respect to public interests, that, perhaps, may be in time accomplished; to convince them of its futility with respect to their own interests, is impossible; impossible, we mean, if our theory of the Corn Laws be correct; if it be true, as it seems to be past doubting, that these laws are beneficial to the landlords precisely from the circumstances which makes them injurious to the public. How, therefore, consistently with the plainest dictates of experience, can we expect from such a legislature as this, a voluntary repeal of what they know to be of great advantage to themselves? How many are the instances, even of individuals, abandoning public abuses which were profitable to themselves? If these be so lamentably few, as to be regarded whenever they occur, as instances of heroic virtue, we may assert, without the possibility of contradiction, that in the case of large bodies of men, no such instance can be found in history. Do we therefore mean to aver that every member of the landed interest, without exception, however great may be the public suffering resulting from a certain course of action, would necessarily prefer that course, if tending to his own advantage, to any course which might militate against it, however conducive to public benefit? in fact, to use the language of common life, that there are nothing like disinterested motives in human nature—that the narrow considerations of self interest prevail in all men, and on all occasions, to the exclusion of every social motive and every benevolent feeling?

We know that this interpretation has been attempted to be fixed upon all occasions on the language of those men, who from reflection and habit have acquired so much sympathy with the people, as to find an interest in detecting the arts, and unravelling the sophistry of those who find a greater interest in misleading them. Language, like that we have just used—assertions that the selfish prevail over the social interests in the case of bodies of men and the concerns of Government—has in our case been averred to mean, that

"Whoever pretends that he acts upon public principle, from a sense of duty, is an impudent pretender, or quack, who, in opposition to the unvaried experience of ages, would have

us believe that he is exempt from the common incident of humanity, the disposition to prefer self to others\*."

This objection, if sincere, is too foolish; and, if insincere, too dishonest, to require a deliberate answer. Opinions like these never entered into the head of any man, unless we may make the exception of those who could deliberately (if deliberately, and not rashly) impute them as the legitimate inferences from the sentiments expressed above.

So far from entertaining opinions of this extravagant nature—so far from denying the existence of public principle in the instance of excellent individuals, we are indeed very far from imputing *deliberate* selfishness, even to the great mass of those over whose language and conduct the selfish motives exert a predominant sway. When we accuse the majority of the landlords of judging and acting in this question from motives of self-interest alone, do we mean that every individual of that body voted for the enactment, and votes every session for the continuance, of the restraints on the corn trade, with the distinct intention of sustaining the rate of rent at the expense of the whole British people? Assuredly, we mean nothing of the kind. We are well aware of the all but irresistible influence which the affections, in other words, the interests, of men exercise over their judgments; of the ease with which they glide into the opinion that that is best, which is best for themselves; how, by dwelling on the favourite idea, they cannot see any opposite idea, and how what they wish to be true, they easily believe to be true. The fact is notorious; the statement of it is proverbial.

That such persons should deny the operation of selfish motives on their actions, is no more than any man would expect; in such cases, men's actions speak more sincerely than their words †.

Amongst those members of Parliament who belong to the landed interest, there are doubtless individuals whose sympathies with the people are so strong as

\* Edinb. Review, vol. xliv. p. 687.

† Mais se peut-il que les motifs, qui agissent sans cesse sur l'esprit d'un homme, soient un secret pour lui-même? Oui, certes, cela se peut. Rien de plus aisé, rien de plus commun, disons plus—ce qui est rare, ce n'est pas de les ignorer; c'est de les connaître. (*Politique des Assemblées Législatives*, (Bentham) par Dumont, tom. ii. p. 237.)

to overcome "the natural disposition to prefer self to others;" there are also individuals of an opposite stamp; individuals who, whether blinded by sinister interest, or deliberately yielding to its impulse, exhibit nothing, which does not amount, in its effects, to a sacrifice of others to self. The existence of such a class of individuals, we shall proceed to prove; the proportion they bear to the whole number cannot, indeed, be shewn, the majority (like all majorities) being dumb: but upon this head the course of universal experience can leave no room for doubt.

It is useful to observe the tactics played off by this body of men. They consist of a string of fallacies, put forth with far less precision, as less able to bear the light, than those which are bottomed on the basis of public good: now and then, however, an indiscreet or unskilful tongue, betrays the modesty of selfish motives—and hints are dropped, and imprudent confessions, and barefaced threats are made, which, though they do not display the whole system of selfishness, are highly valuable in enabling us to illustrate its real nature and extent. For this purpose we have selected, as before, a set of the leading fallacies, which we shall examine in the following order:

1. For the purpose of removing suspicion as to their motives, and asserting a claim to peculiar favour, may be observed a continued iteration of encomiums on the landed gentlemen, and professions of disinterested motives.

2. An assumption of the necessity of supporting the influence of the landed gentlemen, coupled with intimations of their intention of supporting it themselves—with avowals more or less explicit of selfish interests.

3. Intolerance of discussion.

4. A protestation against altering the Corn Laws, without compensating the landlords for the fall in rents.

5. A proposal to effect the compensation by a tax on funded property, &c. &c.

1. On the class of these fallacies, consisting of mere *laudatory personalities*, remark is almost superfluous. The following are a few examples:

Mr. Calcraft.—"It was unfair to say that the country was in the gripe of rapacious landlords, and that the landlords were the only obstacles to its having cheap bread. Give the landlords of England the same chance as the  
SESS. 1826.

landlords of other countries, and they would sell their corn as cheap. *The landlords of this country had long been renowned for their generosity*, and he knew of nothing which they had recently done to impair that character\*."

Mr. Sumner.—"There were no gentlemen who had a more national character than the landlords, or who more deeply sympathized with the distresses of the community†."

Mr. Curwen.—"He was anxious to rebut a charge made upon the land-owners, that in keeping up high prices they were looking only to their own interests (hear, hear). He should blush at rising in his place, if he felt that such a stigma deservedly attached to that body (hear, hear). But he was glad to know that such was not the case. In advocating their interests, they were advocating those of the public at large‡."

Without commenting on the probability of the truth of these asseverations, it is obvious to remark their irrelevancy to the matter in hand. It may be shewn, perhaps, that the landlords are not men but angels: it will not, however, be the less certain, that the laws against a free trade in corn, are *bad*. The value of these declarations, as a *vindication of motives*, may be appreciated from the remarks with which we introduced the section. We shall only add, that the asseverations themselves are mere asseverations: that resting on no specific proof, specific disproof is needless: that counter asseverations have precisely the same claim to credit: that in addition to their infirmity as mere asseverations, they are asseverations in their own favour; and when prisoners are acquitted at the Quarter Sessions, on swearing to their own innocence, we may think of reverting to these *dicta*, as evidence of the magnanimity of the landlords.

But there are other fallacies of this nature which admit of, and require a more specific answer. When the Earl of Lauderdale reproaches Lord King

"with heaping aspersions on a body of men distinguished for their generosity, who had made a more generous provision for the poor than any other men, and whom the noble lord nevertheless chose to stigmatize as grinding the poor§;"

it is right to remind him, that however generous the motives which induced the ministers of Queen Elizabeth to commence that system of demoralizing the poor, it is pretty certain that their generosity was bestowed at the expence of the nation—

\* *Ante*, p. 323.

† — " 336.

‡ *Ante*, p. 377.

§ — " p. 327.

it is pretty certain that every act of the "generous body" for a long series of years has been directed to getting rid of that portion of the poor-rate which they pay as consumers of corn—it is pretty certain, too, that supposing them to have advanced their money to the poor, they avoid the consequences of their generosity by a law, which enables them to add it to the price of corn.

The Duke of Atholl's opinion of "generosity" is still more economical. A petition against the Corn Laws had been presented from the weavers of Perth, whereupon the Duke of Atholl communicates the following information to the House, and adds a very singular remark.

"He could inform the house," he observed, "that a few years ago, when those very people were in distress, no less than 1500 of them were maintained by the landed interest of the neighbourhood, and he had in his possession letters from them which were full of expressions of gratitude for the kindness they had experienced. *It was a poor return for these very men now to petition against the persons who had fed them.\**"

Let the reader mark the steps by which this conclusion is arrived at. In consequence of the depression of prices, to which (as we have shewn above) the Corn Laws themselves had conduced, 1500 weavers in Perth were left without the means of support. In this conjuncture, the landed interest of the neighbourhood—very laudably—relieved them from starvation; for in Scotland there is no "generous provision" by which such relief can be enforced as a legal right. But this relief, it seems, is not to be repaid by thanks—it is not merely eleemosynary—it is a bargain; it is a stipulation by which, in consideration of the temporary aid of the landed interest, the weavers are to be for ever estopped from opposing the landlord's Corn Law. This is the strict interpretation of the Duke of Atholl's remark. But a bargain is the exchange of equivalents: in the tacit agreement between the weavers of Perth and the landlords, the weavers could never mean to barter their birthright for a mess of porridge; they could never mean to say that, provided they were rescued from starvation, they were willing to submit for ever to the burthen of the Corn Laws—to the annual payment of millions for the loan of thousands—to the perpetu-

ation of a system calculated more than any other to produce an endless series of the very calamities they endured, for the sake of immediate relief from those calamities.

Observations, like this of the Duke of Atholl, dropping, perhaps, casually and without reflection, may be thought not to merit the censure we have here bestowed. It is, however, precisely because they are casual and unreflected, that we judge them of so much importance. What is said in that manner, is generally the *habitual* feeling; and with what pretence can a body of landholders expect to escape the charge of selfishness, when they are perpetually letting fall expressions which denote an habitual inattention to the welfare of the million—an habitual and unreflecting sacrifice of the public good to their own advantage! In proportion as society is advanced in civilization, and the power of the aristocracy less complete, this habit is weakened and suppressed. We have only, however, to go back a stage or two in barbarism, and we shall find it in all its barefaced odiousness; we shall find a bench of Irish magistrates describing any expression of complaint on the part of the people, "as phrases . . . tending to destroy the good feeling that ever must exist in well-ordered society, between the higher and lower classes, by forcing THE JUSTLY DISGUSTED LANDLORDS to expend the income of their estates far distant from their lands, and by leaving a demoralized and unemployed peasantry to all the rigours of offended law, THAT THEIR DISCONTENT MIGHT BRING UPON THEM\*."

It will not be forgotten that the *discontent* of the Irish tenantry, a discontent at which their landlords were justly disgusted, was manifested in their voting against the landlords. It seems, from the Duke of Atholl's speech, that as voting is a demonstration of disgusting discontent, petitioning is a proof of ingratitude.

2. The next division is more important. In the following quotations the character of the misleading or corrupting bias becomes more apparent: it becomes more apparent that, on whatever ground, the landed class is to be held up as the ill-

\* *Ante*, p. 325.

\* See the newspaper reports of the resolutions of a meeting of magistrates of the county of Louth, October 3d, 1826.

important one; the class to whose interest the interest of all other classes are, or ought to be, subservient.

The Earl of Aberdeen:—"Notwithstanding all the sneers and jests which he had heard directed against the landed interest, both in and out of that house, he was still of opinion that on that interest was founded the constitutional Government of the country. He had yet to learn what had occurred to induce men to change the opinion, that the land-owners, the yeomanry, and the peasantry, formed the most valuable part of the population. These being his sentiments, he would not be backward to resist any measure which appeared calculated to injure the landed interest\*."

In the same strain, and in stronger terms, the Lord Chancellor, adopting the sentiments of Lord Redesdale †, declares,

"That he should think that the ministry were committing one of the greatest possible offences against the state if they were to propose measures calculated to injure the landed interest, for he was most fully persuaded that every other interest in the country was so interwoven with this, that all classes of the community would be sufferers by any neglect on the part of the Government to protect the agriculturists with the most fostering care; but he did not see that the present measures (the Corn Bills of last Session), were likely in any way materially to affect the landed interest. . . . As to the objection which had been urged against this measure (the Importation of Corn Bill), that it was an interference with the Corn Laws, it was without the slightest foundation: this bill had no connexion with those laws; and he would assert with the utmost sincerity, that if he thought it would at all affect them, nothing on earth should induce him to vote for it: for the support of the landed interest was in substance, and effect, the support of the constitution of the country ‡."

We beg the reader to recapitulate in his own mind the evil effects which have been a thousand times proved beyond denial, against the system of the Corn Laws; their effect on the profits of stock; their tendency to produce ruinous fluctuations; the wasteful expenditure of the national resources, by which, at a cost, it has been said (and the exactness of the statement is immaterial—it is enough if it resemble the truth)—at a cost of *fifteen or twenty millions*, they accomplish their end of putting a fifth part of that sum into the pockets of the landlords. If such a process be "in substance and effect the support of the constitution of the country,"—if to propose any change in this process be "to commit one of the

"greatest possible offences against the state," then do the words State and Constitution mean the landlords, and the government of the landlords; and the statement amounts to a plain assertion of the superiority which their interests should enjoy above those of the whole community. "*Moi, je suis l'état*," was the maxim of the French king. It seems to be no less the maxim of the English aristocracy.

In these extracts, however, the veil which conceals the seductive interests (if that is to be the supposition) from the perception of the speaker, and is meant to conceal it from the hearer, is more happily disposed for the purpose, than in those we are about to transcribe.

Speaking of the same measures alluded to by the Lord Chancellor, the following are the words of Earl Grey:

"When Government declared that they saw no means of alleviating the distress but by adopting measures for the reduction of the price of corn, what was this but holding forth an idea, that the Corn Laws were the cause of the calamities? Could it be possible, after this, that a cool and unprejudiced consideration of that great question could be entered upon? The landlords were held up, by these measures, as selfish and oppressive persons, who prevented the poor from having that relief which the repeal of the Corn Laws alone could give. He (Lord Grey) had no wish to make professions, respecting his sense of public duty; but for his own part he disclaimed any sordid and ungenerous sentiments in defending himself, and his interests, from those who attacked them. He would appeal to his whole life whether he had suffered views of personal interest to bias him! But he would not deny that he felt a natural anxiety to preserve that property to his family which had been handed down to him from a long line of ancestors (hear, hear). This was the feeling of their lordships generally: and although no man was more willing to make any personal sacrifice for the good of his country, he felt it was a hardship that the house should be so placed by the acts of Government, that for the part they might take in that debate, they should expose themselves to obloquy, for having openly, honestly, and fairly, proposed their opinions, and defended their rights. Whatever might be the odium attached to opposing the present measure, he was prepared to encounter it\*."

"He had not taken part in this debate from personal considerations, though he knew not why a candid avowal of regard to private interest should not be allowed to those belonging to the land, as well as to members of all the other classes. It was by the care which each class bestowed on itself, that the welfare of the whole was best promoted †."

In this passage we remark the struggle

\* *Ante*, p. 370.

† *Parl. Review, Sess. 1825*, p. 705.

‡ *Ante*, p. 381.

\* *Ante*, p. 381.

† *Ante*, p. 382.

with which a vigorous mind endeavours to extricate what happens to be a peculiar interest, from the operation of an incontestible principle. It is sufficient to contrast the phrases. Lord Grey first speaks of "defending his interests;" and in the same breath denies that his conduct was ever biased by such views. For the vituperative epithets of "sordid and ungenerous," let us substitute a neutral term—let us speak of *selfish* sentiments, and we shall find the noble person disclaiming all selfish sentiments at the very moment when he talks of his "natural anxiety to preserve his property in his family\*," when he lays claim to applause for "a candid avowal of regard to private interest," and (overlooking the circumstance of the whole power of Government being vested in a single class) concludes with the broad position that "it is by the care which each class bestows on itself, that the welfare of the whole is best promoted."

How just is the remark of South, "that whatsoever puts a bias upon the judging

\* Speaking of the natural desire of every man to preserve that property in his family "which has been handed down from a long line of ancestors,"—speaking of this desire, as justifying the imposition of a heavy tax on the community, it may be worth while to remind the highly-descended persons in whose lips this language is so graceful, that if the phrase be meant for an argument, it were better to make it accurate in the terms.

By property, no doubt, is understood the value of property—the rental, and not the estate. At what knot in the "long line" the rent of land was higher, or so high, as it would be now under an open corn trade, we have not succeeded in discovering. Taking so recent a link in the chain of illustrious progenitors, as the generation of 1770, we find from Mr. Easton's Evidence (Lords' Report, 1814), that "in the parish of Bradford, in Somersetshire, from the year 1773 to 1782 the price of land was about 19s. 6d. per acre, exclusive of the church and poor rates and repairs, which were then paid by the landlord. From 1783 to 1792 the land was worth about 20s. 6d. an acre, the landlord being subjected to the same burdens. From 1793 to 1802 the land was worth about 30s. an acre, the tenant then paying the rates; and from 1802 to 1812 the land was worth about 40s. an acre, to the landlord, the tenant paying the poor-rates, as in the last case." Will noble persons maintain that the lands handed down from their ancestors will be impaired in the possession of posterity, by being reduced to the ancestral rental? As well might the rector aver that a law which should trench upon the 109l. per annum, which he received in 1814, in lieu of 47l. 13s. the amount of his tithes in 1792 (Lords' Report, Mr. Buxton), was an invasion of the property of the church.

"faculty . . . weakens, and by consequence darkens the light of it. A clear and a right judging conscience must be always impartial; and that it may be so, it must be perfectly *indifferent*: that is to say, it must be free, and disencumbered from every thing, which may in the least sway, or incline it one way, rather than another, beyond what the sole and mere evidence of things would naturally lead it to. In a word, it must judge all by *evidence*, and nothing by *inclination*\*."

In an early period of the debates on this question, we find the following language attributed to Sir Francis Burdett. Speaking of those persons (and mistaken, certainly, they are) who attribute the misery of the lower classes to the sole operation of the Corn Laws, he says that

"This sort of declamation was idle at the best, and moreover was calculated to excite mischief, and stir up feelings of animosity against the most important class of the country, on whom alone our power depended—he meant the landed interest (cheers). He knew the character of the land-owners—for he belonged to that interest himself—and he could say with perfect impartiality, that throughout Europe, throughout the world, and even in that portion of the new world which he was inclined to view with a favourable eye, on account of its liberal institutions, there was not a set of men to be found who could be compared with the landed proprietors of England for the exercise of all the virtues—and most important ones they were—connected with their situation†." (Cheers.)

On examining this passage—loud as were the cheers which it elicited—we admit that nothing definite can be concluded from it with respect to the nature of those virtues which are so lavishly attributed to the landed gentlemen: but we gather from the frequent recurrence of eulogistic epithets, that it was at least the speaker's intention to impute extraordinary merit, and bestow extraordinary praise.

What, then, was our astonishment on reading a second speech of Sir Francis Burdett's on Mr. Whitmore's motion for a committee? In that speech, besides vindicating the harmlessness of the Corn Laws, by a train of very shallow sophistry—besides imputing the highest degrees of excellence to institutions, which tend, in fact, too often to engender the anti-social interest we complain of, in the breasts of the land owners, Sir Francis

\* Sermon at Christ-Church, Oct. 29, 1693.

† *Ante*, p. 324.

Burdett takes occasion to assert, and to re-assert, not once or twice, but many times, the propriety of voting on the question of the Corn Laws, not on public principle, but on grounds of private advantage.

"He was not," he said, "so disinterested as not to feel for himself and those belonging to him; and if, as a gentleman of England, possessing a landed estate, he could feel that the measure in question was likely to be seriously injurious to him, he should oppose it. But he was convinced, that in maintaining the station in which accident had placed him, he was but supporting the interests of society in general \*."

Again:

"He was not prepared to say that—in a different view of this question,"—(if he thought the Corn Laws conducive to the interest of the land-owners,)—"he should be inclined to merge his whole personal rights and interests in a scheme for the public advantage. The rights and interests of those immediately connected with him, whether they ought to do so or not, would, he believed, have weight with him, in preference to any general consideration †."

He adds, that

"If he believed, with the country gentlemen, that there was any need of the Corn Laws, he should feel it his duty, as well as his interest, to maintain them. This he did not believe to be the case ‡."

Lastly:

"He did not think, therefore, that he was, as a landed gentleman, making any sacrifice by voting for the motion: he laid claim to no great virtue in doing it, but he thought he was promoting the public interest by such a vote, and not injuring the landed interest §."

The history of this language (which we will not characterize by an epithet) we believe to be this. Sir Francis Burdett, (unless our memory deceive us,) was formerly a supporter of the Corn Laws; he once, we feel assured, subscribed a sum or sums for the purposes of Mr. Webb Hall's association. With many others, he has seen cause to change his opinion; and these expressions may possibly have been used with a view to obviate suspicion as to the motive for the change—to obviate any suspicion that the change was a sacrifice to popularity, that it was any thing but the result of impartial inquiry. 'True,' it may be construed to mean, 'I once thought

otherwise; but I now believe that the Corn Laws are not essential to the welfare of the land owners, and as I would assuredly support whatever tended to promote our welfare, you have the best possible proof of the sincerity of my present language.'

If this may be admitted to excuse, it cannot justify the language in question. What a man deliberately says, he is generally understood to mean; the mass of mankind will assuredly so interpret his language, whatever qualifications it may receive from the candour of individuals. Considered in its literal meaning, what is the force of these expressions? They convey a maxim of universal extent; there is no reason for limiting its application to this or that particular question: if it be true in the instance of the Corn Laws, it is true of any other legislative act. The lesson it teaches is this: that in matters of Government the advantage of individuals, where it *can* be, *may* be avowedly preferred to the public good; the interests of the few, to the interests of the many:—the reverse of the maxim on which any thing like good Government must be founded; that is, a preference of the many's interest to the interest of the few. That the interests of individuals, where they can be, will be, preferred to any other consideration, is, generally speaking, undeniable; that they will too often be preferred under a Government constituted like our own—a Government on which the force of opinion acts only from a distance, and at second-hand, is not to be disputed. He, however, who pursues such conduct, is not the less an enemy to good government, and however blameable it may be *to act*, it can scarcely be less blameable to *approve—to recommend—to teach*. The effects of an act often cease with the perpetration of the act; but a lesson is meant as an encouragement to many acts, and a direction for their performance.

How necessary it is to visit such expressions with censure, to deter the governing body, by the only penal instrument in the hands of the public—the expression of their dispraise—from conduct inimical to the public; and more especially that part of the Government (the House of Commons) which is more accessible to censure, may be still more plainly inferred from the conduct of that portion of the Government—the

\* *Ante*, p. 337.

† —, p. 338.

‡ *Ante*, p. 337.

§ —, p. 339.

House of Lords—who are truly stated to be “more exempt from the influence of popular clamour and prejudice than the other house”—that is, more completely irresponsible, more perfectly exempt from control. What is the House of Lords, that *would be* the House of Commons, were it not for their less complete exemption from popular “clamour.”

In a memoir circulated among the land-owners of a part of the continent, and printed in Mr. Jacob's Report, is the following singular passage:—

“Our ardent hopes for a rise in the prices of corn, founded on the expectation that England may open its ports, have unhappily again vanished. The new liberal policy adopted by England, with regard to commerce, has not been extended to the corn trade; and the motions of Mr. Huskisson and Mr. Whitmore, as well as the numerous petitions that were laid before Parliament, did not meet with any success. It is doubtful whether they will have a better fate in the next sessions, should even a new parliament assemble; the influence of the members of the House of Lords, whose interests (in this instance) are at variance with those of the community at large, being too prevailing.”—Jacob's Report, (Appendix,) p. 64.

According to the Earl of Limerick, this passage is a libel upon the House\* ;—Lord Lauderdale is “convinced that no member of that House would look to any other object in the discussion than the ‘public good†;’” and many other noble lords are doubtless ready to declare the exemption of their body from the common incidents of our nature. It would seem, however, that Lord Liverpool takes a less exalted view of the moral purity of that house. So little is his confidence in their disinterestedness, that in the midst of a speech on the currency, he purposely goes out of his way, to counsel moderation in their debates whenever the Corn Laws should be discussed:

“He was afraid,” he said, “from what he could observe in the house, that when that subject came on to be discussed, a great deal of heat and passion would be evinced on both sides. But he would recommend their lordships to look at it as one which called upon them to take a cool and dispassionate view of it; not with the consideration as to whether the rents of the landlords, or the wages of the labourers, were to be high or low; but with a view to discovering what would be most likely to produce the least violent fluctuations of property. The truth lay there, and he who solved that problem would come to the wisest conclusion. In alluding to this subject, he had gone out of his way; but he had

been led to it by referring to the fluctuations of property, and he could not help intreating of their lordships, when they came to consider it, to do so coolly and dispassionately, and with reference to the whole community\*.”

With reference to the whole community! But observe the language of the noble Earl, when debating the two Corn Bills of last session.

“He would tell the noble lords,” he said, “who complained of the injurious effect which the present measures would have on the general question of the Corn Laws, that if any such effect was produced, it was the fault of those who opposed them. It was well known that when the measures were first proposed in the other house, they were hailed universally as well by those who supported the agricultural interest as by those who supported the manufacturing interest. It was owing to the opposition offered to the measures in the House of Lords, that the opposition exhibited in the other house took place. Those who introduced the measures stated that they were not intended to have any effect on the question of the Corn Laws. The opposers of the measures, by putting it into the heads of people that they were connected with the general question, had done that which they alleged ministers to have done†.”

Such language in the mouth of a Prime Minister is sufficiently plain; but if we wanted an interpretation, it is presented in a speech of Lord Carnarvon, who, speaking of the same measures, observed that—

“They had been introduced to their lordships by the noble earl (Liverpool) in a speech by no means complimentary nor constitutional.—a speech, which amounted almost to menacing their lordships with the public execration, should they refuse to pass these measures; but, notwithstanding that speech, their lordships would do their duty to the country—without any sordid motive or self-interest, but voting without any bias, as they thought was best for the welfare of the whole community‡.”

The reader may choose between the opinions of these noble persons. In the meantime, we may point out an ingenious project proposed by the Earl of Aberdeen (all tending to betray the influence of sinister interests in the house) for eluding the censure of the public. It occurs in the following passage:

“It would be wise,” he said, still speaking of the Corn Bills, “on the part of the landholders not to put forth a strong opposition to these measures. They were bound to make some sacrifice, if it were only to the prejudices of that large class who were looking forward with anxiety

\* *Ante*, p. 363.

† *Ante*, p. 322.

\* *Ante*, p. 327.

† *Ante*, p. 351.

‡ *Ante*, p. 383.

to the decision of this question. Their lordships possessed no great a share of the love and respect of the people as the more popular branch of the legislature. By the nature of their constitution they were more exempt from the influence of popular clamour and prejudice than the other house. He was the last man that would yield any thing to clamour or intimidation; but he thought that their lordships had now an opportunity, without compromising their own dignity, and by giving up little or nothing, to remove from themselves the odium which too many persons were anxious should attach to them. This was of the question, could not, he trusted, be over-looked by their lordships.\*

This expedient, however, of flinging a tub to the whale, is too moderate for men in possession of power. We have seen with how little precaution they betray their sinister motives—it is useful to select a single instance of their betraying the consciousness of their power, and the barefaced mode in which they exhibit its use, in furthering these sinister interests.

3. It occurs in the tumultuous insolence with which Mr. Whitmore's motion was debated. Prudent men, even when strong enough, still refrain from the open exercise of power when their ends may be attained without exciting the dislike which such a use of power is sure to occasion. This prudence is commonly resorted to by the landholders who rule the Parliament: it is resorted to whenever their interests are not immediately concerned. Not so, however, on this occasion,—an occasion in which their dearest interests are in issue, and which calls forth all their spleen, and exhibits all their intemperance. Let the reader turn to the report of Sir Francis Burdett's speech†: he will there see with what impatience even a favourite speaker was treated, at the close of a debate of no extraordinary length—a debate in which not a single speech (the cursory observations of Messrs. Sumner, Curwen, and Wodehouse, cannot be called so) was delivered by that majority of 250, who rejected the motion with disdain. If we should quote the contemptuous language in which Mr. Brougham described the tumult which attended this ceremony, we should probably be called coarse and ill-mannered: we must, therefore, refer the reader to the passage‡.

4. 5. This essay has already extended so far beyond our ordinary limits, that we are compelled to dismiss the remaining heads of the present section without particular comment. The topics contained under these heads are, (4.) A claim of compensation by the landed interest for the toll in rents which may ensue upon a repeal of the Corn Laws, and (5.) A proposal to effect the compensation by an increase of the national debt. On these subjects we can only afford space to insert the following extracts.

FRIDAY, FEB. 24.—Lord King presented a petition against the landlords' rate—the bread-tax, or the corn law, from the operative weavers of Perth.

The Earl of Linlithgow begged to know whether the petition contained any proposition for compensating the landlords on account of the loss they would sustain by an alteration of the law?

Lord King.—“No. The weavers of Perth have too much good sense to put so absurd a proposition into their petition.”

To the following observation of Lord Grey we shall revert hereafter: that nobleman is reported to have used, and the House of Lords to have applauded, the language of this passage:

“I admit that faith with the public creditor ought to be kept by great sacrifices, if sacrifices are of avail for that purpose. But it is a sound maxim of law, that *nemo tenetur ad impossibile*, and if the Government be placed in a situation in which it is impossible to keep the country in a state of decent prosperity, it is not required to do impossibilities, and so throw the whole state of society into confusion by attempting them” (loud cheering)†.

Such language requires little comment, and we dismiss it, for the present, without regret, as we shall find occasion to dwell upon the proposition it insinuates, in the concluding essay of this volume. If such, however, is the language of one landlord, we are bound to notice with approbation the sentiments expressed by another. Sir T. Lethbridge told the house, that—

“They must consider that they had 30 millions to pay the public creditor; and he would rather sell the coat off his back than that he should be defrauded of what was fairly due to him. The nation was bound to pay its debt, and the credit of the nation would be destroyed by the slightest infraction of it‡.”

\* *Ante*, p. 370. † *Ante*, p. 337.  
‡ *Ante*, p. 337.

\* *Ante*, p. 322. † *Ante*, p. 344.  
‡ *Ante*, p. 349.

We notice this passage with greater pleasure, as we rarely happen to concur with the speaker in any opinion on this question.

The proceedings we have thus described and criticized, whilst they distinctly point out the causes of the perpetuation of the Corn Laws, point also to the means by which these causes may be removed. So long as the landlords are to all practical purposes, the exclusive "members of parliament, and those who make the members of parliament," and so long as public opinion is directed against them with so little concentration and force, there can be no reason to hope for any effective change. Landowners are not worse than other men: they only act as all other men would act if clothed with irresponsible power. The one thing wanted is to strip them of that power: to effect it, the only practicable method is to strengthen the force of opinion, and to raise up a power without the doors of Parliament, which shall control the deeds of those within it—a power which shall compel them to reform themselves. So far as our humble efforts can contribute to this end, by presenting the proceedings of the legislature to the public eye, under every aspect and in every form, in that view they will be steadily directed.

#### *Silk Trade.*

THE law for the admission of foreign manufactured silks on payment of an *ad valorem* duty of 30 per cent. passed in 1824; but the operation of the act was deferred. The time fixed for the removal of the absolute prohibition on the introduction of these goods for home consumption which then existed, and for the commencement of the new system, was the 1st of July, 1826. The attempts made to induce Parliament to re-consider this law, or still further to postpone the enforcement of it, gave rise to some discussions in the session of which the proceedings are now under our review.

The steps taken in 1824 to prepare for the introduction of the new system, deserve some notice, not only on account of their effect on the opposition offered to that system in the last session, but because the experience of their result may be of use on future occasions. At the time when it was enacted that foreign manu-

factured silks should be admitted into consumption in 1826, the high duties which existed on the import of raw silk were at once reduced. The removal of the prohibition on manufactured silks was made prospective, in order to give warning to our manufacturers; the reduction of the duty on raw silk was made immediate, in order to give them encouragement. The import tax on East India raw silk was reduced from 4s. to 3d. per lb.; of European raw silk, from 5s. 6d. to 6d.; of organzine, or thrown silk, from 14s. 10d. to 7s. 6d.

In order to stimulate consumption by an immediate reduction of price, and at the same time to remove complaints as to the depreciation of stocks in hand, the duty which had been previously levied, was repaid not only on the raw but also on the manufactured silks in the hands of the merchants, manufacturers, and even shopkeepers. The probable effects of this expedient for preparing the way for the introduction of the new system, and for reconciling the manufacturers to the trial, must have been very insufficiently examined.

If any evil was apprehended from the removal of the prohibitory system, it must have been, that the admission of foreign silks would produce inconvenience and loss to our own silk manufacturers, rendering useless a part of the property of the masters, and lessening the demand for the labour of the men. But this was an evil likely to be felt (other circumstances being equal) in proportion, to the amount of capital employed in the Silk Trade; and to pave the way for the opening of the trade, it would have been rational rather to have diminished than increased the extent of the home manufacture.

The effect to be expected from the almost entire removal of the tax on raw silk was, that the consumption of silk goods would be greatly extended; and it followed as certainly from this extension—more especially at a period of great commercial speculation—that much new capital would be attracted to the manufacture of them. The actual result was very striking. The quantity of silk, raw and thrown, imported in 1823, was 2,512,164 lbs.; in 1824, it increased to 3,137,000 lbs.; and in the first nine months of 1825, it was 3,431,000 lbs. New looms were made, new mills set to work, new factories built. In Macclesfield, one of the chief seats of the Silk Trade, at

advertisement was issued for from 4000 to 5000 persons, who were offered employment in this manufacture. It has been said, that this influx of people was called for to break up a combination among the workmen in the silk trade; but the existence of a combination which required such an effort to break it, proves the extent of the demand which existed for the labour of the combiners. The price of labour was not the only price affected; the demand caused by the impulse which had been given to the consumption of silk, occasioned an advance of price, which at last became more than equal to the tax which had been removed. Raw silk rose from 9s. to 24s.; thrown silk, from 33s. to 53s. per lb.

Thus, by this "preparatory step," and by a sacrifice of some consequence to the revenue, a host of enemies to the new system was raised up—a multitude of new workmen exposed to the hazard of the experiment, and to the certain inconvenience of the suspension of demand which preceded it. This step seems to have been taken in consequence of the representations of the manufacturers themselves, who alleged that the amount of the duties formed a great discouragement to their trade. From this vague declaration, they wished it to be inferred, that to remove this discouragement was the way to enable them to meet foreign competition. But this discouragement was in fact only an increase of the cost of production, by means of a tax which tended to restrict the demand for the goods of the supply of which these manufacturers had the monopoly. A reduction of the tax was in its first effects advantageous to the monopolists themselves; an increase of demand beyond the immediate means of production was produced, and an encouragement to the trade was given, by transferring to the pockets of the monopolists a part of the tax, before levied for the benefit of the public.

A peculiar obstacle to the introduction of the new system, was raised, by this reduction of duties, in the increase of the throwing business. The duty on raw silk was reduced in a greater proportion than the duty on thrown silk; a great increase of the business of throwsters took place, and a great inducement was afforded to invest capital in this branch of the trade. But as the time for the removal of the prohibition drew near, the high price of

thrown silk was one of the disadvantages of which the weaver most loudly, and most justly, complained. The remedy would have been to have removed the duty on its importation; but to this removal, the increased importance of the throwing trade, in this country, presented itself as an objection. The duty on thrown silk was, however, subsequently reduced.

The mistaken policy of these preparatory measures has been scarcely ever publicly adverted to, because the persons engaged in the silk trade gained by them, in the first instance, at the expense of the public. But we think their nature is sufficiently established, to serve as a warning against a resort hereafter to plans for the encouragement, or extension, of a monopoly, as a preparation for breaking it down.

At the end of 1825, and the beginning of 1826, the silk trade suffered from a reaction, not greater than that experienced in some other manufactures, but produced in part by peculiar causes. The quantity of capital drawn into the trade in 1824, and the speculative demand which had been created, had raised the price of the raw material. This gave the first check to consumption, which was subsequently still further diminished by the pecuniary distress prevailing at the time. The silk manufacturers of London convened a public meeting, where, among other extravagances, they declared that a duty of 60 per cent would not protect them against the French silk goods. The intelligence promulgated by these competent practical authorities, that foreign silks admitted at 30 per cent duty would make all home-made goods unsaleable, contributed to induce the retail dealers to diminish their purchases, with a view to clear away their stocks. Under all these circumstances—some arising out of the expectation of foreign imports—some out of the measures taken to prepare for the new system—some out of those taken to frustrate it—some entirely accidental—a considerable degree of distress existed in the silk trade, which threatened to raise a formidable opposition to the removal of the prohibitions at the time fixed by law. Nothing can shew more plainly the feebleness of the opponents of the changes in our system of trade, than the figure which they made in their opposition, in spite of the mistakes of their adversaries.

It should be observed, that a short time before the opening of the session, the ministers issued an order that 5s., instead of 7s. 6d., per lb. should be levied on foreign thrown silk, taking bond in the usual way for the payment of the additional 2s. 6d., if Parliament should not confirm the reduction. This reduction (blameable only because it was too tardy, and too small) was confirmed.

Petitions were presented, soon after the opening of the session, from the silk throwsters and manufacturers in various parts of the kingdom, and after a few previous conversations, a set debate took place in the House of Commons, on the motion of Mr. Ellice for referring these petitions to a select committee.

The debate on this motion was looked forward to as the grand struggle between the theoretical and practical men, and preparations seem to have been made by the latter party, to overwhelm their antagonists by imputations of want of knowledge, unsoundness of judgment, and hardness of heart.

"The minister," Mr. Baring observed, "should consult before he legislates the practical man, who looked at the effect while the theorists were calculating upon the cause, and who *told* them, that a thing was not so, when they proved, by direct ratiocination, that it must be so\*." The meaning of this seems to be, that it is extremely unwise to trust to reason in opposition to the assertions of practical men, and that though we might prove by reasoning that two and two must make four, we ought to be satisfied with the information of practical men, if they tell us, that they *do* make five.

As they condemn reasoning, a few specimens of their facts will be instructive. By their facts they must be judged; and if we believe them in future, we must do so, in spite not only of reason but of experience.

1. Mr. Baring: "The master silk weavers were unanimous in their opinion, that if French silks were let in, there was no chance of selling a single yard of English silk†."

2. Mr. Ellice: "It was evident that the proposed protection of 30 per cent would be perfectly nugatory. It would be no protection at all‡."

3. "At St. Etienne, and at Lyons, there were no less than 12,000 looms for the manufacture of fine ribands, and it was calculated, that of these, 3000 were sufficient to supply all the markets of Europe\*."

4. "In one little town in Switzerland, more real capital was embarked in this branch of manufacture (the silk trade), than was employed in it throughout the whole of this country†."

5. "It was known that, at the present moment, there was a stock in the warehouses in Switzerland, sufficient for the consumption of this country for four years to come‡."

To the two first of these assertions, the result is a sufficient answer: the two last are unparalleled in the annals of commercial credulity. In one little town of Switzerland, (so little that Mr. Ellice apparently had forgotten the name), the Electors of Coventry had persuaded their representative, that more capital was employed than in the whole silk trade of England—a trade, which, according to Mr. John Williams, gives employment to 500,000 persons, and the value of the produce of which is estimated at about 14 millions sterling. It never seems to have occurred to Mr. Ellice, to ask upon what the capital in this little town could have been employed. He took, however, a nice distinction between capital and securities:—"They (the manufacturers of Switzerland) did not deal in bills, and other securities of that kind, as was the case here, and which had lately led to such calamitous results. No; they traded in actual *bonâ fide* capital§." Mr. Ellice seems to have imagined, that factories are erected and weavers fed by bills and other securities; but surely if this were the case, we should have a vast advantage over our competitors. This is a fine instance of the use of the catch-words with which practical minds content themselves. It happens in this country, that the persons who employ capital are not always the proprietors of it; and, as Mr. Ellice has probably seen traders who are called men of no capital, and who carry on business without money or goods of their own, by getting possession, on credit, of the money and goods of others—he has applied the phrase to a great branch of

\* *Ante*, p. 409.

† *Ante*, p. 386.

‡ *Ante*, p. 388.

\* *Ante*, p. 389.

† *Ibid.*

† *Ante*, p. 390.

‡ *Ibid.*

manufacture. Mr. Ellice may be assured, however remarkable it may appear, that when money is borrowed, money also is *lent*, and that a house and a bale of silk do not cease to be a house and a bale of silk, because the one is built with borrowed money, and the other bought upon credit.

But what is the use of proving by ratiocination, that the capital which employs some unknown portion of the population of a town of 15,000 people in a cheap country, cannot be so large as that which actively employs 500,000 people in a dear country? The practical men set the matter at rest by saying it is greater. What is the use of suggesting that if 3000 looms would supply all Europe with ribands, 12,000 of them would not long continue to be employed in two towns of France?—The thing is so. What is the use of doubting whether silks, equal to four years consumption of this country—that is to say, in value about 56 millions, at our prices—can be stored up in Switzerland; or whether its inhabitants, who have been commonly deemed poor, can possess, on the average, every man, woman, and child, about 30*l.* worth of silk goods at our prices? The fact is so: practical men have said it; and for the idle theorists who are “calculating upon the cause” of such a phenomenon, we may observe, that Mr. Ellice assures us, the Swiss take care always to sell for ready money. As it would take all that the mines of Mexico can produce for fifteen years to purchase this stock of silks, no wonder it accumulates.

But the practical men must alter their form of expression: and as, heretofore, in opposition to the proof that a thing *must* be so, they opposed their declaration that it *was* not so; *now*, they may assert that the result must be as they predicted, in opposition to the proof, that it is not. The importation of foreign silks, and especially of French silks, is quite insignificant, compared with the extent of the trade; and Mr. Ellice’s fifty-eight millions of silks from Switzerland, the average difference of price in favour of which, as compared with our own manufactures, was from 50 to 60 per cent and from 60 to 100 per cent\* on figured goods (per Mr.

Baring, p. 410,) have not “yet come to” “hand.” It will be necessary, therefore, for our practical men, guided, according to their favourite doctrine, by circumstances, not only to claim, as of wont, exemption from the conclusions of reason, and faith in their wildest predictions; not only to challenge belief for the most extravagant and absurd assertions respecting the state of other countries, in opposition to evidence carefully taken from witnesses, subject to severe examination,—all which, on the mere strength of the word practical, they are as of right entitled to;—but to demand that the nation shall be blind to facts, passing under its own eyes.

It is not however in facts merely that practical men are great; they have the sole privilege of tenderness of heart, which was claimed in their behalf by Mr. John Williams. This gentleman quoted with approbation—as applicable to theorists who pursued their abstract principles, independently of “any consequences”—Mr. Burke’s description of the quality of heart, possessed “by a perfect metaphysician, which exceeded that of the devil”—“himself in malignity, and contempt for “the happiness of mankind.” It is strange enough to see a plain, sober man, like Mr. Williams, following the champion of the age of chivalry in such a flight. It well became one whose habit was to exaggerate—whose business was to cover with the glare of eloquence every evil which was strong enough to threaten mankind with durability, and to turn into horror at improvement the regret which should be felt at the necessary evils of change,—it well became him, passing by tyrants and conquerors, to fix the charge of contempt for the happiness of mankind, upon the perfect metaphysician.

In attributing exclusively to those who carry into effect improvements in laws and institutions, a state of mind which is by no means peculiar to them—and by imputing to them as a vice the performance of the most arduous and useful of all duties, Mr. Burke attempted to corrupt, in a most pernicious manner, the moral feeling of mankind. It is true that men

100 per cent (by which they mean, we believe, 50 per cent); and Sir James Graham has told us that the Austrian currency was depreciated 400 per cent, which means, taken literally, that a pound note was worth sixty shillings less than nothing.—(*Corn and Currency.*)

\* *Ante*, p. 393.

\* This is a form of arithmetic which prevails in parliament, especially among practical men. We hear them speak of property depreciated

who have made up their minds upon a calculation of consequences, to a certain line of conduct, and having persuaded themselves that the line they have chosen is that productive of the greatest benefit to mankind, do and ought to view with less regret than they would otherwise feel the casual suffering with which it is accompanied. But this is not peculiar to theorists. When Mr. Williams, on the northern circuit, prompted by his sense of duty, labours hard to hang a burglar or a sheep-stealer, it would be unfair in the extreme to impute to him a contempt for the happiness of mankind, though the happiness of one of the race is entirely annihilated by the success of the learned gentleman's efforts! It is just to suppose that he reflects on the greater misery which would fall upon society if property were not protected, and though the eventual mischief from impunity is remote, and the real suffering from the hanging is very near and apparent, Mr. Williams having hanged his thief, goes off to dine or sleep with a clear conscience, and a much better opinion of himself, than if he had kept back the evidence, or repressed his talent for cross-examination, and let the rogue escape. He would justly deem those to be corruptors of morals who blamed him for the performance, or urged him to the betrayal, of his trust, merely because by doing so he should please the felon and his friends. But the trust vested in those whose station and knowledge enable them to effect changes useful to a whole nation, is a far more important one than that ever committed to an advocate, and one to the execution of which many more obstacles and temptations are opposed. The love of ease, the opposition of interested parties, the entreaties of political friends, the certainty that even a temporary failure will be used to the destruction of the author of a change—these are obstacles which it requires no small degree of moral courage to surmount, and they are seldom surmounted. But to add to these obstacles popular odium, to impute to every one who has the courage to attempt improvements a peculiar hardness of heart, because some evil of less account must be set off against the greater good he has done, or the greater suffering he has prevented, is a detestable perversion of maudlin sentiment to the degradation and misery of mankind.

While the drones and sloths of the state are held blameless for the misery which their negligence allows to exist; while those who execute the worst laws may be men of the tenderest hearts; and while it would be consistent with the finest feelings to allow a people to groan under any existing oppression, or to sink to ruin under the influence of any existing system, the hatred of society is to be levelled, according to this superfine system of political morals, at the man who attempts to benefit his country—because not being omnipotent, he is unable to do good to many without inconvenience to a few. Though Mr. Williams “fully agrees” with Mr. Burke, we are willing to believe that he understood neither the scope nor the intention of Mr. Burke's expression. The limitation which he introduced (theorists who pursued their abstract principles *independently of any consequences*.) would, if literally understood, reduce that which is mischievous to mere nonsense. Theorists who would pursue principles without regard to *any* consequences, would be, not hard-hearted, but insane. But the impression it is intended to produce is a disapprobation of those who do not look to part of the consequences of a measure to the exclusion of the rest.

It is remarkable, that in the course of the debate no one attempted clearly to explain the principles on which Parliament had, or ought to have legislated in the case before them. On the part of the advocates of the motion, it was assumed that a protection ought to be afforded, and by the opponents this assumption was admitted; but it was contended, that the protection would be afforded by the law about to come into operation. Mr. Huskisson, in his speech (which, as a reply to imputations extraneous to the question, as an eloquent defence of his own motives and conduct, and as a retort upon his adversaries, was one of the most effective ever delivered in Parliament),—though he read the petition of the merchants of London, directed “against every restrictive regulation of trade not essential to the revenue, against all duties merely protective from foreign competition, and against the excess of such duties as are partly for the purpose of revenue, and partly for that of protection\*,”—though he adopted the sentiments of this petition,

\* *Ante*, p. 395.

and declared that it embraced all the great principles of commercial policy upon which Parliament had since legislated\*, subsequently seemed to abandon it, and observing that the object of the British manufacturer was "as much as possible to shut out the competition of his foreign rival†," contended that a protecting duty of 30 per cent—the duty which the new law imposed—was quite as effectual as an absolute prohibition, the only difference being, that in the one case, a certain quantity of silk goods would be admitted on payment of duty, and that in the other, an equal quantity would be brought in by the smuggler. The duty of 30 per cent was fixed,

"because," he observed, "I never yet conversed with a single merchant or manufacturer who did not admit, that if a higher protecting duty was imposed, the supply of foreign silk goods would be thrown into the hands of the smuggler."

Thus, while Mr. Huskisson, adopting the London petition, declares against all protecting duties, he also declares in favour of the highest protecting duty on silk goods which it is possible to levy—a duty practically as effectual in excluding the competition of the foreigner—that is to say, in excluding the benefits of free trade—as an absolute prohibition. It is difficult to ascertain from these conflicting declarations whether the principles of the London petition were admitted as the foundation of the silk law; or, if admitted, why the application of them was so limited as to be equivalent to the old system of prohibition.

It often happens in a legislative assembly, that objections inconsistent with one another are opposed to a measure, and that in the desire to gain converts or to soften opponents, reasons inconsistent with one another are alleged in its support. The ground on which Mr. Huskisson claimed praise from the country, was, that his measure was a step towards free trade; the ground on which he claimed the assent of the silk trade, was that (with some expediency in the execution) it was equivalent to the old system of prohibitions.

As Mr. Huskisson, in defence of his measure, found it necessary to enter at length into the principles upon which his plan of gradual reform in our commercial system is founded, we shall be justi-

fied in pursuing the same course, in defence of a similar plan.

The advantage of foreign trade is to increase the enjoyments of mankind—to enable men to obtain an increase of those enjoyments without an increase of labour. This benefit is obtained in the highest practicable degree only when a perfect freedom of this trade exists. But where restrictions exist, and have long existed, we must, before we remove them, attend to two considerations—the effect of the removal on the interests of the persons to whose capital and industry the pernicious laws have given an unprofitable direction, and the effect on the value of money.

The first of these considerations was repeatedly adverted to in the debate. The second was never once alluded to, with any distinctness, by either party.

With respect to the first consideration: The amount of silk goods, manufactured yearly in England, is estimated at about fourteen millions. Suppose the 30 per cent to be the amount required for a protecting duty, the loss entailed upon the consumer is 3,230,000l yearly. According to Mr. Williams, Mr. Ellis, and the silk manufacturers themselves, the loss heretofore must have been nearly 6,000,000 per annum. It would be clearly profitable if only the vested "interests" were to be considered to pension the whole of the persons employed in the silk manufacture, till they could get other employments, rather than to allow them to continue their ill-chosen occupation. Under circumstances like these, the legislature should never rest content till it had taken means for throwing open the trade (completely, sooner or later) to foreign competition. The opinion we entertain with respect to the only efficient means which can be adopted for this purpose was explained at length in our volume of last year, to which we refer the reader\*.

With respect to the second consideration: The effects which have been produced on the value of money, by the restrictions on foreign trade, and the effect which would be produced on money by the absolute removal of those restrictions, form another and more important reason for caution, and require some development.

The quantity of the precious metals

\* *Parl. Review*, *Sess.* 1825, p. 678. *Vid.* *et* p. 634.

\* *Ante*, p. 395. † *Ante*, p. 404.

possessed by different nations or countries is not always in proportion to their wealth, or the abundance of the products of their labour; nor is their power of acquiring these metals necessarily in proportion to their wealth.

It might indeed so happen that a nation shut in by mountains or deserts, and containing within itself no mines of gold or silver, might possess great quantities of the other desirable commodities, without any of these media of exchange; and an extreme scarcity of these metals would be found to exist in a country which, though rich in certain products, and not separated from other countries by insurmountable obstacles, should be possessed of no commodities which it could readily export to other nations. True it is, that in countries between which there is traffic, the precious metals, from causes which have been often explained, have a tendency to become of equal value—but a tendency to equalization is not equality. This distinction, obvious as it is, has frequently been lost sight of. The tendency may be counteracted by various circumstances, as, in the cases above supposed, by natural causes—in other cases by artificial or legal causes.

A tax, supposing it could be levied, on the import of the precious metals, other commodities remaining untaxed, would raise the value of those metals in the country subject to such a system, and depress prices in proportion to the amount of the tax. *In the case opposite to this*, (which is most common,) the import of all, or nearly all, commodities being taxed, but the precious metals being allowed to be imported free from tax, prices must be raised in the country subject to such a system. In proportion to the taxes upon all other commodities, a premium is given on the importation of the untaxed commodities—gold and silver; and by the accumulation of these metals, or the comparative facility of acquiring them, are prices lowered. Restrictions on the import of commodities must produce an effect similar to that of taxation on that import. The more the range of the commodities which other nations can give us in exchange for our exports shall be limited, the greater will be the temptation to pay us in the precious metals, till the rise of prices amongst us prevent the possibility of our exporting.

Improvements in the arts and machinery used in the manufacture of ex-

portable commodities, produce an effect on the value of money, which has been well explained by Mr. Ricardo in his chapter on foreign trade; and the reasoning which he there employs may be applied to the other causes of variation, of which he makes slight mention. He supposes the case of two countries, Portugal and England; the first producing wine, the last cloth, and exchanging these commodities with one another. If, by some discovery, England were enabled to make the wine more cheaply than she could import it, cloth would nevertheless continue for some time to be exported, because (no change, on the supposition, having taken place in Portugal) its price would continue to be higher in that country than here. But money, instead of wine, would be given in exchange for it, till the accumulation of money here, and its diminution abroad, should so operate on the relative value of cloth in the two countries, that it would cease to be profitable to export it. An effect similar to that produced on the commerce between two countries must be produced, by great and rapid improvements in the manufactures of a country, on the trade between that country and the rest of the world, and must tend to alter the distribution of the precious metals.

"This," Mr. Ricardo observes, "will in some measure account for the different value of money in different countries; it will explain to us why the prices of home commodities, and those of great bulk, are, independently of other causes, higher in those countries where manufactures flourish \*."

In England the various causes which we have mentioned, as likely to lower the value of money in a country, have been powerfully at work—rapid improvements in manufactures, especially the manufactures of exportable commodities; heavy duties on the importation of nearly all commodities, except those of which the importation has been entirely forbidden, or those which are destined to be in great part re-exported. By these causes, operating during a long series of years, the value of the precious metals has been reduced in England, and the price of commodities in which we have not, from superior machinery, or natural advantages, extreme facility of production, are gene-

\* Polit. Econ. and Taxation, p. 130, 3d edit.

rally higher than in any other country of Europe.

This effect was far from being desirable. The rise of prices, even without any sacrifice of the wealth of a nation, is mischievous. Creditors are despoiled for the benefit of debtors, and the sense of security, which is one of the great advantages of good government, is diminished. But where this effect is wholly, or in part, produced by the acts of the government, it is also accompanied by a diminution of wealth and comfort. Industry is wasted, and injustice and insecurity are the results. We must always bear in mind, however, that the evil is not in the high prices, but in the rise of prices: for when prices have been once raised to a certain pitch in a country, whether by the influence of its system of taxation, or by the superiority of its industry, or by the conjoint influence of both causes,—it is equally impolitic and unjust to make any change, of which the only effect is to lower money prices, as it was before to raise them. Debtors suffer in the one case, as creditors did in the other. And if this reduction of prices be effected by the sacrifice of a particular branch of manufacture, injustice may be done to the persons engaged in it, without any corresponding benefit to the community.

Let us suppose, for instance, that between England and France, on account of mutual prohibitions, little intercourse existed, and that from some difference in the system of taxation in the two nations, the value of gold were twice as great in France as in this country; it would happen that, supposing the skill applied to the silk manufacture, and the national advantages for carrying it on were equal in the two countries, the price of manufacturing this article would be twice as high in England as in France. In such a case, suppose that the importation of silk, which had previously been prohibited here, were thrown entirely open, (without any precaution being taken for limiting the quantity imported), and that no corresponding change should take place on the part of France; an exportation of gold would occur, and might go on till the value of that metal was reduced nearly to the same level in both countries. The operation of the throwing open of the silk trade, under such circumstances, would be similar, in fact, to the case supposed by Mr. Ricardo, and quoted above, as far as the

transfer of money from one country to another is concerned.

This abstraction of money from the one country, and accumulation of it in the other, would be the first effect; and with it the silk manufacture of this country would be destroyed, though no wise inferior to that of France, from which we should in the case supposed be supplied. True it is, that, subsequently, an increased export of those manufactured goods, in which our superiority to other nations is decisive, (and which, by the change of prices, might be sold more cheaply than before), might take place, and might ultimately enable us to obtain the silk goods with a smaller expenditure of labour than before. But it is very doubtful whether the comparative abundance of a particular sort of raiment, one of the main causes of the value of which is its comparative rarity, would be an adequate compensation for the change, or changes, in the value of money.

This effect on the value of money, then, forms no reason for creating a system of protecting duties, and for making new restrictions, but should be kept in view in diminishing those protecting duties, and breaking down the restrictions which already exist; and the difference of the value of money, in this and other countries, should be kept in view in estimating the loss which these restrictions entail upon us, and which (great as it is) may, when this circumstance is lost sight of, be much exaggerated. It is upon this principle (if upon any) that a government may be justified in making the removal of particular prohibitions, or high duties, dependent upon corresponding concessions by other states,—a policy which has hitherto been very poorly defended by those who have acted upon it.

It is the consideration of the effect we have described as likely to be produced by a more complete removal of restrictions, which induces us to think that Mr. Huskisson, whom his antagonists have blamed for doing too much, would have been justified in doing so little, (in spite of his own speech), had that little been done upon the right system,—had it been done by means of limitation in the *quantity* of goods imported, and not by a duty\*.

\* Let us not be understood to mean that Mr. Huskisson's measure is *inoperative*. In many branches of the silk manufacture it may act as

But the prosecution of his work should not be lost sight of.

When Mr. Ellice stated, in the debate, that the looms of Coventry were of the worst possible construction, and that the French manufacturer could, with the same portion of labour, send forth five times the quantity of riband as the English manufacturer, he made out the strongest case against his constituents;—he clearly shewed that they could only be protected by an enormous waste of national wealth. But, probably, in making out what they supposed to be a case, the manufacturers exaggerated their own faults, as beggars pretend, or increase, their deformities, in order to excite compassion.

In the course of the session, a bill was brought in to remove the difficulties attendant on custom-house valuations, by charging several descriptions of silk goods named in the act, with a rated duty according to their weight, instead of the tax of 30 per cent, *ad valorem*,—to confine the importation to the port of London, and to regulate the description of packages, and the burthen of the ships. The mode of taxation prescribed in this bill, while it affords facilities for collection, has the disadvantage of being less equal and just than the *ad valorem* duty. It falls least heavily on those articles on which most labour has been bestowed, and which are made of the finest materials: but it is probable, that this inequality is an evil less in amount, than the uncertainty and trouble of the valuation system.

The other enactments of the bill were somewhat modified in their progress through the House. East India silks, and some light goods, are allowed to be imported into the ports to which goods from within the limits of the Company's charter are now permitted to be brought. Other silks, also, may be imported from Bourdeaux to Dublin: but the restrictions on the tonnage of the vessels, the size and weight of package, and even the length and mode of weaving of the pieces of silk remain—proofs of the numerous additional restraints upon freedom of intercourse with which a system of heavy duties must be, or at least are, accom-

a complete emancipation of the trade. It will do so whenever the duty is not high enough to exclude the foreign article. On the other hand, whenever the foreign article is so excluded, the measure will be completely without effect.

panied. We trust, however, that if many of these restraints\* have been imposed, as they apparently were, to satisfy clamorous and over-anxious manufacturers, they will not be allowed to outlive the unfounded apprehensions by which they were dictated.

### *Navigation Laws.*

AMONGST the various measures which have been introduced by ministers for the removal of restrictions from trade and manufactures, the late alterations in the Navigation Laws occupy a conspicuous place. They were not encountered with much opposition in Parliament; but since they came into operation, they have excited considerable attention throughout the country, especially in some of the maritime towns, where they have been viewed with suspicion and discontent. In the course of the last session, therefore, Mr. Huskisson took occasion, in moving for some returns relative to shipping, to explain at some length, his views on this important subject, in a speech replete with sound reasoning and useful information. The present may, therefore, be deemed a proper opportunity for discussing the general principle of the Navigation Laws, as well as for considering whether the late alterations are likely to be attended with the disastrous consequences which some have apprehended.

Restrictions on navigation in favour of British shipping have existed from a very early period of our history; but they were greatly extended in the time of the Commonwealth, and were reduced to a regular system in the year 1651, when the celebrated Act of Navigation was passed by the Republican Parliament. The principle of this act was adopted by the succeeding government of Charles II. and its provisions were embodied in the statute, 12 Charles II. cap. 18. By this statute it was enacted, 1st, That no goods should be imported into, or exported from, any of the English dominions in Asia, Africa, or America, except in English ships, of which three-fourths of the

\* For instance, not only must the packages each contain 100 lbs. weight of silk, but the pieces in the packages must be not less than 60, or more than 66 yards in length, "with ferrels, or marks at each end, wove in."

crew should be Englishmen, and that no direct commercial intercourse should be allowed between the British colonies and foreign countries; so that a monopoly of their trade was secured not only to English vessels but also to English ports. 2nd, That no goods, the produce of Asia, Africa, or America, should be imported into England, except in English ships, manned by English crews. 3rd, Double aliens' customs were imposed on foreign vessels employed in the fisheries. 4th, Foreign vessels were entirely excluded from the English coasting trade. 5th, With regard to the trade between England and the other countries of Europe, there were specified twenty-eight articles, since termed enumerated articles, which were of a very bulky nature, and which consequently employed a great quantity of shipping; and these it was prohibited to import into England, except in English ships manned by English crews, or in the ships of the countries in which they were produced. By this act, then, a monopoly of the whole of the colonial trade, the coasting trade, the fisheries, and the trade between England and foreign countries in Asia, Africa, and America, was secured to the English ship-owner; and even in the greater part of the European trade, the only competition allowed, was, that of the ships belonging to those countries in which the goods to be imported had been produced. Other statutes were subsequently passed, sometimes slightly modifying, but in general enforcing these enactments; and by the statute 13th and 14th Charles II. cap. 11, the importation of a great number of bulky articles (therein specified) from Holland, Germany, and the Netherlands, was absolutely prohibited; shewing, that in those times the policy of the legislature was not merely to advance the interests of England, but to injure neighbouring nations even at her expense.—In addition to the above-mentioned restrictions, foreign ships had been subjected to higher port and other duties than were imposed on English vessels.

Such was the state in which the Navigation Laws remained till the close of the American war. Since, during this long period when these laws were strictly enforced, a great increase occurred in our trade and naval power, we cannot be surprised that the laws themselves should have been regarded as the basis of our commercial greatness, and should have received the

proud appellation of the "*Charta maritima of England*." There are, indeed, many persons who would thus settle the question at once by an appeal to history, and who consider it an act little short of madness to make any alterations in a system which they imagine to have been sanctioned by the experience of ages. There is no fallacy more common than that of concluding, that when one remarkable event follows another, they must be necessarily connected, and the one be the effect of the other. Thus a celebrated writer\* has attributed the wealth of Great Britain to taxation, and has consequently recommended a more liberal expenditure, as the best remedy for national distress. This fallacy is particularly common in subjects connected with political science, because in these cases the judgment is apt to be warped by sinister interest, and great care is required in order to trace the connexion of events, and to assign to each circumstance its due weight. In order to establish the position, that our commercial greatness is the result of the Navigation Laws, it would be necessary to shew, either that the origin of our commerce is to be traced to the period of their enactment, or at least, that they gave a perceptible impulse to its progress. Now it cannot be denied, that the origin of our commerce is to be referred to a much earlier period; that it was in all probability the effect of our geographical situation, and of other circumstances of a similar kind, too obvious to require enumeration; that it had become of considerable importance in the reign of Queen Elizabeth; and that it was gradually advancing with the increase of our capital. It is certain also, that previous to the Restoration, our naval power had become extremely formidable. And so far from its having been proved that the Act of Navigation gave a strong impulse to our commercial prosperity, it is stated by Roger Coke, Sir Josiah Child, and Sir Matthew Decker, the two former contemporary writers, and all men of great practical knowledge, that it was followed by the decline of our trade†. It may, then, at least be questionable, whether the Act of Navigation has answered the purpose for which it was designed; or

\* Mr. Southey.

† Ed. Review, vol. xxviii, p. 402.

whether, on the contrary, instead of acting as an encouragement to our trade, it has not thrown an impediment in the way of its gradual advancement. Still less can it be assumed that all its enactments are adapted to the present altered state of the country, and that experience has been so decisive in its favour, as to forbid all reasoning and inquiry on the subject.

At the close of the American war this country was destined to reap the fruits of her illiberal system. That disastrous war, as Mr. Huskisson has justly observed, may be attributed in a great degree to the efforts of this country to enforce upon her colonies her oppressive code of navigation. When, therefore, the United States had established their independence, it is not surprising that they should have endeavoured to retaliate upon the mother country. Great Britain would, of course, have been glad to admit them to her commerce on the same footing as the nations of Europe; but this was not enough for America, as she had learned a very different lesson from the example which we ourselves had set her. It was determined by congress, in the year 1787, that a duty of one dollar per ton should be imposed upon foreign shipping, and a duty of 10 per cent upon all goods imported in foreign vessels, beyond the duties payable on American ships, and the goods imported therein. This measure was felt as a heavy blow to British commerce. Every effort was made by the British Government to procure its repeal; and at length, in the year 1815, it was arranged that in the ports of each country, all charges and duties should be equal upon all vessels and cargoes, whether English or American. But we are informed by Mr. Huskisson, that the British merchant still lies under a great disadvantage; because the American government, following the example of our Navigation Laws, has prohibited the importation of European goods, except in American vessels, or in the vessels of the country in which the goods were produced; so that whilst the American merchants can make up their cargoes from the produce of any part of Europe, the British are confined to that of Great Britain.

We now come to the late alteration in the Navigation Laws, the propriety of which it is our more immediate business to consider. The greater part of these

alterations were made in the session of 1822, when five very important acts were passed on this subject\*. By these acts the statute book was purged of an immense farrago of useless and contradictory enactments; our code of navigation was reduced to a more simple and intelligible form, and considerable alterations were made in the principle of these laws, as well as in their arrangement. The laws respecting the coasting trade, the fisheries, and the trade between Great Britain and her colonies, were not materially altered, as a complete monopoly of those branches of commerce was still preserved to the British ship-owner. But in most of the other branches of our trade, the competition of foreign shipping was permitted in a greater or less degree. First, With regard to our trade with the other countries of Europe, the "enumerated articles" above mentioned were allowed to be imported, not only in the ships of the country in which they had been produced, but also in the ships of any country into which they had been imported. The enactment, moreover, which had prohibited the importation of certain bulky articles from Holland, Germany, and the Netherlands, was entirely repealed. 2d, As to the trade with foreign countries, in Asia, Africa, or America, the same privileges were extended to the different states which have been formed out of the Spanish colonies in America, as were enjoyed by the United States; so that they were enabled to export their produce to Great Britain in their own vessels: 3d, An act was passed to regulate the trade between our possessions in the West Indies, and America, and other places in the same quarter of the globe. By this act a great number of articles were permitted, under certain regulations, to be imported into the British colonies from other states or colonies in America in ships belonging to such states or colonies, provided that similar privileges were granted to British vessels by their respective governments: 4th, An act† was passed to regulate the trade between our West India and American colonies, and foreign countries in Europe. By the provisions of this act, the direct exportation of colonial produce to European ports was permitted in British ships; and the col-

\* 5 Geo. IV. c. 41, 42, 43, 44, 45.

† *Ibid.* c. 44.

‡ *Ibid.* c. 45.

nies were allowed to supply themselves in the same manner with certain articles from the continent of Europe.

In the following year, an important act\* was passed to equalize all duties and charges upon British and foreign shipping; but at the same time Government were empowered to impose higher duties on ships belonging to countries where higher duties were imposed on British vessels.

In the last session of Parliament, the only legislative measure relating to navigation, was an act† to give effect to treaties of commerce contracted with the new republics of America. It had been found that these states had derived little advantage from the change in the Navigation Laws, owing to the circumstance of their possessing few ships built in their own ports. It was, therefore, enacted, that ships, wherever built, or however acquired, if duly owned and navigated as the ships of those republics, should be so considered, and should be entitled to the same privileges, for the space of seven years, which, it was supposed, would be a sufficiently long period to enable them to supply themselves with home-built shipping.

Such are the changes which the legislature has thought proper to introduce into the system of the Navigation Laws, and which have been received in certain quarters with the greatest alarm and dissatisfaction. The ship-owners complain loudly of the removal of "protection" from their trade. They seem to imagine, like many other classes of persons, that "protection" is a boon of the greatest advantage to themselves, but which at the same time can be granted by the legislature without loss to the public. By "protection" is meant the exclusion of foreign competition; and it is obvious that such exclusion can in no other way be advantageous to the ship-owner than by raising the charge for the conveyance of goods; and that consequently whatever is gained by the ship-owner must necessarily be lost by the public. Yet, simple as this principle may appear, it is continually overlooked in discussions of this kind. Thus Mr. Robertson is reported to have said, that "the shipping of this country had as much right to 'protection as any other trade ‡,'" from which we must necessarily infer that he is

of opinion that protection ought to be afforded to every branch of trade and manufactures, or, in other words, that every class ought to be allowed in turn to tax the community for their own benefit—a notable plan for increasing the aggregate of the national wealth. Yet nothing can be more logical than this conclusion. For if protection be really advantageous to the *protected* party, without a corresponding loss to the public, its benefits ought to be extended to every class. But if every person be allowed in turn to tax the rest of the public, it is manifest that we shall none of us be the richer, but that every one will be the poorer in proportion to the expense of collecting the tax, and to the vexations and restrictions by which almost every system of taxation is necessarily accompanied.

But we have put the case much too favourably, since it is not true, that what is lost by the public is gained by the *protected* party. If Government were to spend a part of the public revenue in employing persons in digging holes and afterwards filling them up, or in any other futile work, it is manifest that whilst the labourers so employed would gain no more than their ordinary wages, the public would lose the whole amount of the revenue so expended. Exactly in the same manner, if capital be forced by impolitic legislation into unnatural channels, the capitalist receives no more than ordinary profits for his stock, and the consumer is taxed by being obliged to pay a higher price for the goods he purchases. No reason can be shewn why these principles are not equally applicable to the carriage of goods as to any other mode of employing capital. Considering the subject therefore merely as a question of national profit or loss, there can be no doubt of the injurious effects of restriction on navigation. And we are supported in this conclusion by the authority of Dr. Adam Smith, whose opinion on this subject has often been triumphantly cited by the friends of the Navigation Laws. He says,

"The Act of Navigation is not favourable to foreign commerce, or to the growth of that opulence which can arise from it. The interest of a nation in its commercial relations to foreign nations, is like that of a merchant, with regard to the different people with whom he deals—to buy as cheap, and to sell as dear as possible. But the Act of Navigation, by diminishing the number of sellers, must necessarily diminish that of buyers; and we are thus likely not only to buy foreign goods dearer, but to sell our own cheaper, than if there was a more perfect freedom of trade. As defence, however, is of

\* 6 Geo. IV. c. 77. † 7 Geo. IV. c. 5.  
‡ *Ante*, p. 438.

'much more importance than opulence, the Act of Navigation is, perhaps, the wisest of all the commercial regulations of England\*.'

It appears, therefore, that Dr. Smith did not advocate the Navigation Laws, as tending to promote the prosperity of commerce or the accumulation of wealth, but as affording the best means of providing for our national security; and it is upon the same grounds that the more intelligent supporters of the system have founded their arguments.

It is manifest that to secure protection against foreign aggression, the legislature would be justified in making great pecuniary sacrifices. There can be no doubt, too, that, in consequence of our insular situation, our national security must in general mainly depend upon our naval force. And it may be true that Government has of late paid less attention to this branch of the public service than might have been desired. But in order to establish the position that the Navigation Laws are necessary for the support of our navy, it must be proved—1. That a sufficient naval force could not be maintained without our present immense commercial marine; and, 2. That the recent alterations in the Navigation Laws will give rise to a great diminution in the quantity of our merchant shipping.

The first of these propositions has in general been treated as self-evident, and has therefore been assumed as a matter of course, without proof or consideration. But it appears, to say the least, very questionable, whether a plan might not be adopted by which our navy might be rendered much less dependent upon our commercial marine for its supply of seamen. Whatever naval force we maintain in time of peace, may, of course, be constantly preserved in a state fit for active service. But the difficulty lies in obtaining a sufficient supply of seamen, on the sudden breaking out of a war. Under the present system this end is accomplished in a very objectionable manner. However large may be our commercial marine, our merchants will, of course, never employ a greater number of seamen than are sufficient for the navigation of their vessels. When, therefore, on the breaking out of a war, an additional supply of sailors is required for the navy, this increased demand for seamen greatly

raises the rate of their wages; and Government, being either unable or unwilling to pay this increased rate, have recourse to the system of impressment, a system odious alike to the seamen themselves, and to the public. In order, therefore, to remedy the inconveniences of the present system, it has been proposed that an establishment should be formed, in which youths should be trained for the service of the navy, and from which it has been supposed a supply of seamen might be obtained in all respects much better qualified for the service than those who are at present forced by impressment from our merchant shipping. And it has been thought that by a supply of this kind, together with those seamen who, by a moderate addition to their wages, would be induced to enter into the naval service, our navy might be sufficiently manned at the commencement of a war. Such a plan has been warmly recommended by eminent and intelligent naval officers, who have expressed their regret, that whilst immense sums have been lavished on other departments of the public service, no attempt has been made to put an end to the odious system of impressment. The only objection to the plan, is its expensiveness. It must, however, be recollected, that a tax is not the less certainly felt, if, instead of being paid to the tax-gatherer, it falls upon the public indirectly by increasing the price of the articles which they consume; and on the supposition that the abolition of the Navigation Laws would be injurious to the shipping interest, we must infer that the existence of these statutes tends to raise the rate of freight, and consequently to encrease the price of all imported goods. By measures of this tendency, therefore, the public must necessarily be taxed, as the inhabitants of London would be, were the legislature to compel the coal vessels of Newcastle to circumnavigate the island, instead of bringing their cargoes by the direct passage to the metropolis. When, therefore, we are making a comparison between the two systems with regard to expense, we must take into the account, 1st. the increased rate of freight, which, on the shewing of the supporters of the restrictive system themselves, the Navigation Law must be supposed to produce; 2d. the increased rate of wages which our merchants are at present obliged to pay at the commencement of a war, and the difficulties in which they are involved from the want of

\* *Wealth of Nations*, vol. ii. p. 194.

seamen to navigate their vessels; and, 3d. the disastrous effects of the system of impressment on the seamen themselves, as well as on the public at large; effects which, if estimated in money, most persons would be disposed to fix at a very high price. If, then, we could estimate, correctly, the loss and inconvenience occasioned by the present system, we should probably find that it would be equal to a considerable amount of direct taxation. At all events, enough has been said to show that the subject deserves consideration, and that it is at least very questionable, whether our present immense commercial marine is absolutely essential for our national security.

Secondly, it has never been satisfactorily shown why the late alterations in the Navigation Laws should be so injurious to British shipping, as many persons apprehend. It is not indeed surprising that they should have been regarded with alarm by the ship-builders and ship-owners; because the restrictive system had existed so long, and had been so often extolled as the perfection of the wisdom of our ancestors, and the palladium of British commerce, that the parties immediately interested were sure to view any change with apprehension. But it has never been stated in what respects ship-building differs from other manufactures; nor has it been shown why, when we are able to manufacture many other commodities so cheaply as to supply not only our own market, but those of the rest of the world, we should be undersold in the article of shipping. And this must appear still more improbable, when we recollect that navigation and ship-building are trades for which we possess peculiar local advantages, and in which we have embarked an immense amount of capital, and that, too, permanently invested in docks and other structures, from which it can never be withdrawn. This impossibility of transferring fixed capital is a circumstance of great practical importance, and one of which the effects have not, perhaps, been sufficiently attended to by writers on political economy. Its influence is felt in almost every mode of employing capital. To take, for example, the instance of agriculture:—If a land-owner found that in order to bring a piece of land into cultivation, an expenditure of 20*l.* per acre would be required in draining, manuring,

fencing, &c., he of course would not invest his capital in this manner until the price of corn had risen to such a point that it would pay him the ordinary rate of interest, which, at 5 per cent, would amount to a rent of 20*s.* per acre. If corn were afterwards to fall in price, his rent would of course fall at the same time; but the land would not be thrown out of cultivation until the price of corn had become so low that it ceased to pay any rent to the landlord, or even ordinary profits to the farmer. Yet it has been frequently maintained by writers on the Corn Laws, that if inferior lands were cultivated in consequence of a rise in the price of corn, a corresponding fall in its price must necessarily throw them out of cultivation—an error into which they have fallen from not attending to the effects of the investment of fixed capital in the land. The same principles are applicable to ship-building and navigation. Great Britain has already invested an immense amount of capital in docks, warehouses, &c., for which she of course would be content to receive only a diminished return rather than abandon it altogether. But it is manifest that no other nation would invest its capital in a similar manner without the prospect of at least ordinary profits. So that the possession of fixed capital may fairly be reckoned amongst our facilities for the building of ships.

It may perhaps be said that we lie under a disadvantage in being obliged to import a considerable part of the raw material of ships from abroad; but this is equally the case in the manufacture of several other articles. It has also been contended that, in considering the present question the immense amount of our taxation, and the Corn Laws, should be taken into the account. There can be no doubt that heavy taxes, and a high price of corn, are injurious to the ship owners, in diminishing their profits, and preventing the increase of their capital, as well as to every other class of capitalists; but they lay them under no peculiar disadvantage as compared with other manufacturers. There are, however, some taxes which press with peculiar severity upon the shipping interest—we mean the duties upon timber, canvas, cordage, and other articles, employed in the construction or equipment of ships—which certainly ought to be either abolished or greatly reduced,

and we would more particularly call the attention of our readers to the present discriminating duties upon Baltic and Canada timber.

The duties upon Baltic timber amount at present to no less than 2l. 15s. per load, or nearly 300 per cent on its value; whilst Canada timber is subject to a duty of only 10s. It appears from the evidence of eminent ship-builders and timber merchants, before a committee of the House of Lords, that Canada timber is softer in its texture, much less durable, and more subject to the dry rot, than the timber of the Baltic: so that the effect of the present duties is to oblige our ship-builders to import an inferior article, from a greater distance, and at a much higher price. Mr. Huskisson, indeed, mentions in his speech\* the advantage possessed by the United States, from the greater cheapness of their timber; but he slurs the matter over as one of secondary importance. We are sorry to find the following expressions in another part of his speech—expressions utterly inconsistent with the principles which he usually professes, and with those liberal measures of which he has been the able and successful advocate. He says,

“Looking to the shipping interests of this country, and to the interests of Canada, I am not one of those who think we have done too much for those interests, in the great preference, in point of duty, which we have given to the Canada timber, and in the consequent sacrifices which we make to encourage the importation of that timber, inferior as it is.†”

It is, then, principally for the sake of Canada that this system is maintained. The reasoning of some of our ministerial speakers, on the subject of the colonies, is certainly of a very singular kind. Whenever complaints are made of the enormous expense which the colonies entail upon the country, (as for instance, Canada itself, which alone costs us not less than 500,000l. per annum), we are informed that, although the expense may be considerable, the colonies are indirectly beneficial by means of their trade. And now, when we complain of the immense loss occasioned by these restrictions on our trade, we are told that the monopoly must be maintained for the benefit of the colony. So that, first, an expensive colony is to be retained for the sake of the trade; and next, a losing trade is to be carried on for

the sake of the colony. Such are the reasonings to which the supporters of this system are obliged to have recourse, and such is the mode in which the interests of the public are sacrificed to the selfish interests of the legislature.

The ship-owners will therefore act wisely in uniting to obtain, if possible, a repeal of the high duties on Baltic timber. It has, indeed, been said that they would be the first sufferers from such a measure, inasmuch as the trade with Canada must, in consequence of its greater distance from Great Britain, employ a greater quantity of shipping than the trade with the Baltic; and some of the ship-owners, acting on this principle, have gone so far as to demand an increase in the discriminating duty. But admitting that the exclusion of Baltic timber might produce an immediate increase in the demand for shipping, yet this temporary benefit would form but a slender equivalent for the injurious effects of a system which, by increasing the price of shipping, must lay them under a permanent disadvantage as compared with other maritime nations, and must tend ultimately to exclude them from all the commerce of the world, excepting those particular branches of which the complete monopoly is secured to them by the restrictive system of Great Britain.

It has been stated that the late alterations in the Navigation Laws have already produced a decline of our trade. This point has, however, been ably contested by Mr. Huskisson. But whatever the fact may be, we have no hesitation in stating our opinion, that with the exception of the duties we have mentioned, which press with peculiar severity on the shipping interest, the measures of ministers upon this subject have been highly deserving of approbation. Nay, if, instead of consulting the public interests, their views had been confined to the interest of the ship-owners, they could not have adopted a different line of policy; since we are convinced that the late restrictions would have ultimately proved as injurious to the ship-owners, as to every other class of the community. So long as foreign governments were accustomed to treat commerce and navigation with neglect and contempt, it was comparatively easy to exclude foreign vessels from our ports, and to secure to ourselves a monopoly of the carrying trade. But beholding Great Britain grow rich

\* *Ante*, p. 435.

† *Ante*, p. 431.

and powerful in consequence of her commerce, and attributing her prosperity to her restrictive system, they were naturally disposed to follow in her steps, and to enact for themselves protecting codes of navigation. And this was manifestly in their power. It was as easy for any foreign country, for Prussia for instance, to exclude British ships from her ports, as for Great Britain to exclude those of Prussia. If, therefore, this system had become universal, it could have ended only in the cessation of all commercial intercourse; an event, which would have been more injurious to Great Britain than to any other country, because she is more dependent on foreign commerce, and of all classes of the British public would have been most disastrous to the ship-owners themselves. But we cannot do justice to this part of our subject better than by quoting the following passage from Mr. Huskisson's speech:

"Have we not boasted of our Navigation Laws, till we have taught other nations to believe (however erroneous that belief), that they are almost the only requisite, or, at least, the *sine quâ non*, of commercial wealth, and of maritime power? Did these vauntings excite no envy, no spirit of rivalry, no countervailing opposition in other countries? Did the success of the United States of America create no desire in those countries to follow her example? It would be worse than idle, it would be dangerous, to dissemble to ourselves the great changes which have been wrought since the establishment of American independence, in the views and sentiments of Europe, upon all matters connected with commerce and navigation. They now occupy a leading share in the attention of almost every government. They are every where a subject of general inquiry and interest. Even in countries, of which the institutions are least favourable to the discussion of political topics, these questions are freely discussed, and by discussion, the influence of public opinion is made to bear upon the measures and policy of their governments. In this altered state of the world, it became our duty seriously to inquire whether a system of commercial hostility, of which the ultimate tendency is mutual prohibition,—whether a system of high discriminating duties upon foreign ships, with the moral certainty of seeing those duties fully retaliated upon our own shipping in the ports of foreign countries,—was a contest in which England was likely to gain, and out of which, if persevered in, she was likely to come with dignity or advantage? I will lay aside, for the moment, every consideration of a higher nature, moral or political, which would naturally lead us to look with some repugnance to the engaging in such a contest. I will equally lay aside all consideration for the interest of our manufacturers, and for the general well-being of our population, who, as consumers, would obviously have to pay for this

system of custom-house warfare, and reciprocal restriction; and I will view the question solely in reference to the shipping interest. In this comparatively narrow, but I admit, not unimportant, view of the question, I have no difficulty in stating my conviction, a conviction at which I have arrived after much anxious consideration, that, in the long run, this war of discriminating duties, if persevered in on both sides, must operate most to the injury of the country which, at the time of entering upon it, possesses the greatest commercial marine. How can it be otherwise? What are these discriminating duties, but a tax upon commerce and navigation? Will not the heaviest share of that tax fall, therefore, upon those who have the greatest amount of shipping and trade?"

Such reasoning must convince the most bigotted supporter of the restrictive system of the necessity of making some relaxation in the enactments of our Navigation Laws; since it is evident that their enforcement must for the future prove equally injurious, whether we regard the interests of the public, the maintenance of a naval force, or the advantage of the ship-owners themselves. But if we adopt a more liberal system, and at the same time relieve navigation from any burdens under which it exclusively suffers, we see no reason to suppose that we may not successfully compete with foreign nations, and continue to advance in our commercial career.

It is not one of the least remarkable circumstances attending the late alterations in the Navigation Laws, that they have excited but little opposition, or even attention, in the House of Commons. Throughout the delivery of the whole of Mr. Huskisson's speech, the House was remarkably thin, so much so, as to excite a remark from the speaker himself. It is difficult to understand how the members of the House reconcile their absence on so important an occasion with the duties of their professed character as representatives of the people.

Whenever a debate is expected, which is likely to give rise to animated declamation, or to personal invective, and which is calculated to amuse the hearers, without requiring too great a degree of intellectual exertion, though the subject may be one of comparatively trifling importance, the House is crowded with members. But when a subject is to be discussed of a less amusing nature, which may require a little serious attention, and

some exercise of the understanding although it may be of the greatest importance, and may involve the prosperity of our commerce and our national security, and although the debate may be opened by one of the ablest of our ministers, and with a speech calculated in the highest degree to interest and instruct an intelligent audience, yet on such an occasion a large majority of the members think themselves justified in disregarding alike the duties of the offices which they hold, and the interests of the constituents whom they pretend to represent. But such are the natural effects of *virtual* representation.

There is, however, one point of view in which we may be allowed to congratulate our readers on the non-attendance of members on this occasion, viz. as it affords a proof of their tacit concurrence in, or indifference to, the measures which have been adopted.

"Thirty years ago," as Mr. Robertson justly remarks, "no British minister would have *dared* to make such propositions to parliament\*," and they are now regarded so much as matters of course, that members do not think it worth their while to attend the discussion. Such a fact must prove that enlightened opinions are rapidly gaining ground, as well in the House of Commons, as amongst the public at large.

## LAW.

*Licensing System;—Public Houses.*

IN order to attain a clear view of the effects of the licensing system, it will be proper to begin with a brief outline of the history and state of the laws, by which the sale of fermented liquors is placed under restrictions, not attached to the sale of other commodities.

Previously to the reign of Edward VI. it was lawful, according to one of the older law authorities, "for any one to keep an alehouse without licence; for it was a means of livelihood which any one was free to follow; but if it was disorderly kept it was indictable as a common nuisance." In the reign of Henry VII. however, justices of the peace were empowered to suppress useless houses, and by the 5th and 6th Edward VI. to *put away* such common ale or tippling houses as they thought meet and convenient, and none were

to keep such houses in future but such as should be allowed in open session, or by two justices of peace, who were to take bond and surety by recognizance of alehouse-keepers for preserving good order. The 1st James I. c. 9.—after reciting that the true use of inns and alehouses is for the relief and lodging of wayfaring people, and not for entertainment and harbouring of lewd idle people, to spend their money and time in lewd and drunken manner,—subjects to penalties the keepers of alehouses who suffer people to tittle; and the 7th James I. c. 10, disables an alehouse-keeper, convicted in such penalties, from keeping an alehouse for three years.

Ill effects having been produced by an act passed for encouraging the distillation of British spirits, early in the reign of William and Mary, by which all persons were authorized to distil and sell British spirits, provided the duties were paid, the 12th and 13th William III. c. 11 and 18, enacted, that no person should sell brandy, or other distilled liquor by retail, to be drunk in their houses, but such as should be licensed in the same manner as alehouse-keepers; but by 1st Anne, c. 14, distillers, and shopkeepers whose dealings were more in other goods than in brandy, and who did not permit tippling in their houses, were allowed to sell spirits by retail without licence.

Up to this period, the licensing laws appear to have had no other object than the preservation of the public morals and peace; but from the time of George II. they have been applied also to fiscal purposes.

By the 2nd George II. c. 17, a duty of 20l. is imposed on the licence to sell spirits by retail, which licence is ordered to be renewed yearly; and by the 11th section of the same statute, no licence is to be granted to any person to keep an inn or alehouse, or to retail brandy, but at a general meeting of the justices of the peace, to be holden for that purpose, on the 1st of September yearly, or within twenty-one days afterwards, the object of which general meeting is stated to be, that the justices may be truly informed as to the want of inns or alehouses and the character of persons applying for licences.

The 6th George II. c. 17, repealed the duty, and imposed a penalty on all who should sell spirits in sheds, stables, or

\**Ante*, p. 421.

wheelbarrows, without living in the same. From this act we may infer, that the expense of the licence had driven the vendors from houses to sheds and wheelbarrows. The 10*l.* penalty, however, appears to have been eluded; for, by 9 Geo. II. c. 23, it was enacted, that no one should vend spirituous liquors without a licence, for which he was to pay annually 50*l.* to the excise; that no licence should be granted but to keepers of public victualling-houses, inns, coffee-houses, alehouses, or brandy-shops; and that the penalty for selling without a licence should be 100*l.* The expense of this licence, and the duties on spirits, immediately gave an impulse to illicit distillation and illicit sale; and, to the great injury of the revenue, threw the trade into the hands of those who took out no licence, and who paid no duty: therefore, by a statute of 16th George II. the 50*l.* licence was reduced to 20*s.*, and the duty on spirits lowered from 20*s.* to 3*d.* a gallon.

The 24th George II. c. 40, s. 8, next required, that no one within the limits of the head office of excise should retail spirituous liquors unless he rented a tenement of the yearly value of 10*l.* or upwards, or in any other part of the kingdom, unless he paid to church and poor; and the 26th Geo. II. c. 31, enacts, that the justices shall bind in a recognizance of 10*l.*, with two sureties of 5*l.* each, the parties who receive the licence, while every person who applies for a licence is to produce from the clergyman of the parish where the alehouse is situated, and the major part of the churchwardens and overseers, or three or four substantial householders and inhabitants, a certificate of his good fame and sober life. Upon complaint made, a justice is empowered to bind the complainants to appear at the sessions, and if a verdict is found against the defendant, he is to forfeit his recognizance, and be disabled from having a licence for three years. By the 30th George II. c. 24, s. 14, publicans permitting journeymen, labourers, servants, or apprentices, to game in their houses, are to forfeit 40*s.* for the first offence, and 10*l.* for the second.

The transfer of licences at petty sessions, is regulated by 32 George III. c. 59; and by 48 George III. c. 143, the licences are to be taken out at the excise office, instead of being issued by

the justices, but are not to be granted unless the person applying shall first produce an authority signed by two justices of the peace, to keep a common inn, alehouse, or victualling-house.

In 1817, the committee on the police of the metropolis, in a report of great ability and discernment, as to every thing but the suggestions with which it concludes, pointed out a great number of the evils occasioned by the licensing system; but the legislature slumbered over the matter till 1822, when an act, pursuant to the suggestions of the committee, was passed\*, increasing the amount of the publican's recognizance for good behaviour to 30*l.*, with two sureties of 10*l.* each, or one of 20*l.*, and prescribing a form of recognizance, in which every species of *cauponic* delinquency is minutely enumerated and forbidden. The preliminary certificate of good character is also guarded by a number of minute provisions, only to be equalled by the particularities of a French passport.

On the other hand, as some compensation to the publican for this increase of rigour, those parts of the statute of 7 James I. c. 10, and of other statutes, which disable a publican convicted by a justice of peace from keeping an alehouse for three years, is repealed, and for the future he is to be fined not exceeding 5*l.* by a justice of peace, for a first offence; not exceeding 10*l.* for a second; for a third he is to be sent before a jury at the sessions, and if convicted, to be fined not exceeding 100*l.*, his licence to be void, and himself disabled to sell ale, beer, cyder, perry, spirituous liquors, or strong waters, for the space of three years.

This act, which was to have expired last session, has been continued to the present, though, as might have been anticipated, very little effect has been produced by such petty legislation.

From the foregoing outline, it is plain, that though fiscal regulations have been engrafted upon the laws which require publicans to obtain a magistrate's licence, the main object of those laws has been to repress tippling and immorality among the poorer classes of the community. Whether or not they have in any degree attained their object will be presently shewn; but one effect, probably not foreseen, they have un-

\* 3 Geo. IV. c. 77.

questionably produced. They have given to the opulent brewers a monopoly of the supply of beer to the poorer classes.

Mr. John Adams, a respectable spirit-dealer and hop-merchant, who, for 25 years, had travelled in the way of his business through the counties of Berks, Hants, Wilts, Somerset, Gloucester, and Oxford, stated to the Commons' Committee, on the police of the metropolis \*, that in some of those districts this monopoly was nearly general, and in others rapidly gaining ground: That wherever a public-house was offered for sale it was bought up by a brewer, or spirit-dealer: That in Reading, where there were 67 or 68 public-houses, two only were free, and those the principal inns in the town: That the consequence of the monopoly was, that the beer was of an inferior quality, and that the poor and middling classes, living in those districts, complained heavily of the badness of the commodity which they were compelled to drink, no other being in the market: And that they were thereby driven to the use of spirits.

Mr. Schultze†, a solicitor, stated, that at Wallingford, out of 18 public-houses 14 belonged to brewers; 12 or 13 of which were the property of one, who was, besides, a magistrate of the county, and alderman of the borough: that complaints against the badness of the beer were universal, and, that from experience, he knew that from that cause alone, the common people were driven to the use of spirits: that at Newbury the monopoly was so complete, that, in the borough of Speenhamland, of 10 public-houses, belonging to a charity, 8 were in the hands of one brewer, and two in the hands of another.

Mr. Barclay, a member of the House, stated, that in his trade, which was the greatest in London, one-eighth of the houses they served were their own property; that about three-eighths of the remainder were engaged to them by the advance of money, leaving four-eighths entirely free‡.

In the trade of Whitbread and Co., it appeared that one-seventh were their own houses, or held on lease, and about three-sevenths free§. In that of Truman and Hanbury about the same proportion; but Mr. Hanbury, speaking

of his partner, Mr. Aveling, says, that no plot of ground has been laid out for building without his obtaining immediate notice; and in cases where he thought it advisable, without his purchasing the most eligible spot for a public-house, or at least obtaining the offer of it\*.

The committee refrained from examining further into the monopoly of public-houses in the hands of brewers, distillers, &c., which exists in different parts of the country, from a conviction that it would only lead to an unnecessary multiplication of evidence; but they conclude with observing, that the practice is hourly increasing.

With regard to the effect of this monopoly upon the *price* of the article, two circumstances are to be taken into account, besides the facility which a limited number of producers always possess of imposing their own terms in the sale of their commodity. These circumstances are the increase of value which the licence gives to a public-house, and the precariousness of the publican's interest in it.

It is manifest that publicans, in order to draw from their trade the average rate of profit, must obtain out of the price of the article they sell, not only a compensation for the additional cost of their houses, but also for any extraordinary insecurity to which their trade may be subject. According to the evidence adduced before the committee, the value of a house is increased from 500*l.* to 2000*l.* by the circumstance of a publican's licence being attached to it; and while the magistrates have the power of refusing to renew the licence at their annual meetings, the insecurity of the property may be estimated by the two following cases:—

Mr. Meek entered into a public-house in 1814, the lease of which cost him 1000*l.*†. The house was licensed in 1815, but in 1816 the licence was suspended, although no complaint had been made; and two magistrates, who visited the house, declared themselves satisfied with its construction, which was the same as in 1815. Mr. Meek, however, had, in the meantime, ceased to deal with his first brewers, Meux and Reid, who, six weeks before the licensing day, got to

\* See Report from the Committee, *Sess.* 1817. No. 233. p. 119.

† *Ibid.* p. 126.

‡ *Ibid.* 236.

§ *Ibid.* 240.

\* *Ibid.* p. 249, 250.

† *Ibid.* p. 25.

serve a house within four doors of his; and he had also quarrelled with the high constable for defrauding him in a supply of coals. The magistrates assigned no reason for refusing the licence, and Mr. Meek was ruined.

Mr. Dell took a public house in 1811, for which he paid near 4000l \*. From that time to 1816 the house was annually licensed, and no complaint was ever preferred against it. Two magistrates, before the licensing day, suggested some slight alteration of the counter, which was effected; the licence was, nevertheless, suspended without any reason being assigned, and Mr. Dell's property reduced from 4000l. to 1000l. The committee examined both these parties, and represent them as most intelligent and respectable men.

But passing by the consideration of the suffering occasioned by these and many similar instances of individual oppression, it will scarcely be denied, that the increase of price and deterioration of quality thus occasioned by the licensing system, in an article which is, or ought to be, a necessary of life among the most numerous classes of the community, are evils of great magnitude. The existence of these evils being established, and their cause ascertained, it is for those who would uphold and continue the system, to shew that it is productive of good effects which outweigh the evils in question.

Till they shall have made some such attempt, we can only notice the objects proposed in the preambles to the various statutes by which the system has been established.

The prevailing object, as we have shewn before, has been, the prevention of tippling, and the conservation of the morals of the poorer classes.

Now, supposing this to be, as it is professed to be, the chief object of the system, it will be impossible to advocate its continuance, if it can be shewn, that, fraught with evil as the system is, it has altogether failed to attain such its professed object; or, if means can be pointed out by which that object may be at least, as fully, if not more fully, attained, without the accompaniment of so much evil.

First, then, the object has been in no degree attained.

The framers of the acts must have proposed to attain the object, either by lessening the number of public houses, or by regulating the conduct of those who keep and frequent them. In both these points they have equally failed; but before we shew to what extent, there is a preliminary topic which ought not to be passed by unnoticed.

It has been stated, that the adulteration in the quality of beer,—the natural result of monopoly,—in many instances, drives the poorer classes to the use of spirits. Mr. Adams affirms, that in houses where good beer has been drawn, the consumption of spirits is comparatively trifling, but where the beer has become bad, that consumption has greatly increased\*: this alone is productive of the worst effects upon the morals and health of the community. The experience of every age and nation has shewn, that stimulants will be resorted to for the support and alleviation of human toil; but of all stimulants, ardent spirits are notoriously the worst, whether in their tendency to increase the appetite for indulgence, or the quick and excessive intoxication which they produce, when taken in large quantities, or their ruinous effects upon health. To prohibit them directly would only be a fruitless, and, therefore, vexatious interference with general freedom of action; but it is clear, that the use of them may, to a considerable extent, be indirectly repressed, simply by taking off the restrictions which affect the sale of beer.

The mischief produced by the encouragement now given to the consumption of ardent spirits, forms, however, but one small item among the points in which the licensing system has failed to advance the public morals; and this brings us to its effects upon the number of public houses.

It appears distinctly from the evidence before the committee, that the great London brewers have obtained so complete an ascendancy upon the bench of magistrates, that the discretion reposed in that body, with respect to the granting, withholding, or suspending licences, is seldom or never exercised, but for purposes of partiality and oppression; and so far have they been from limiting the number of public

\* See Report from the Committee, Sess. 1817, No. 233, p. 27.

\* *Ibid.* p. 123.

houses, that in the most depraved districts, where, if any where, such a limitation might be contended to be beneficial, the multiplication of these houses has been permitted, to an extent incompatible with the publican's gaining a livelihood, except by resorting to discreditable means.

Although in some districts, it has been the custom for magistrates personally to inspect the houses for which new licences are solicited, yet, in High-street, Shadwell, according to the evidence, one house in twelve is a public house\*; in Lower Shadwell, one in six; in New Gravel Lane, one in eight; in Norton Folgate, there is one to every seventy-three persons†; in Whitecross-street, there are twenty-three in three hundred yards, maintained principally by disorderly persons of both sexes; in some other streets, there are four or five within a few doors of each other‡. Mr. Bowles, a magistrate for Surry, says, that "in his district, public houses are greatly more numerous than are required for the wants of the people; they exist in clusters"§. Mr. Beaumont says,

"There are two new houses in Trafalgar-street, City-road; the neighbourhood is very thinly peopled, so that its wants could form no part of the consideration, but the different sides of the street are in different divisions of justices; the Finsbury justices opened the first house, one year; the Tower justices the second, the next: the house in the Tower division was the one built for the purpose, the other was a very small one, of which a lease had been taken by Mr. Campbell, a dentist in White-chapel, a particular friend of Sir Daniel Williams, who licensed it. Mr. Campbell sold the lease for 500*l.*; as soon as the penny was turned, but not before, the public house opposite was allowed a licence||."

Mr. Gifford, one of the magistrates of Worship-street, stated, that in going round with the inspecting magistrates of the Tower district, it was agreed to grant a licence to a new house which had been refused the preceding year; the only reason he could discover for the change of opinion was, that the house had changed its owner¶: he further stated, that licences are granted with great facility, and far beyond what is necessary for the public accommodation. That upon a petition of

many respectable inhabitants, a licence was refused one year to a house in Morgan Lane in the Borough; the house, however, was opened by the fraudulent transfer of a licence granted to another, and though the man was prosecuted by the Commissioners of Excise, yet the licence was granted the following year\*.

Mr. Beaumont stated, that one Roberts, having solicited a licence for a house at Shepherd's Bush†, it was represented that he was not the owner, though he had sworn himself to be so; the licence was nevertheless granted: at the ensuing meeting of the magistrates, the licence having been transferred, a full disclosure of the perjury was made, when the justices refused to allow the transfer: at another meeting, however, the Hammersmith magistrates came in a body, and allowed the transfer, outvoting the others by one.

Mr. Beaumont further stated that no vigilance was exercised on the part of the magistrates of the Tower division to examine into the claims of new candidates for licences; that they resolved immediately, it being but the work of a moment; that on the last licensing day they licensed a small brick-shell in Marshall-street, Hoxton, against which a petition was presented by a great part of the neighbouring inhabitants; and that another unfinished house was licensed at the bottom of Pitt-street, Bethnal-Green, belonging to Messrs. Hanbury, there being in the vicinity six public-houses, two very near, and the whole within three hundred yards. Being asked if the propriety of licensing these houses, on the ground of their necessity for the accommodation of the neighbourhood, was discussed in the meeting of the magistrates, his answer was, "there were very few words; there was no discussion, no argument used‡."

Mr. Bowles stated that 30 or 40 transfers are sometimes granted in a day, without investigation, under a notion that the duty is merely ministerial, and that the magistrates have no discretion, even in cases where, from the gross misconduct of the publican, he could have very little chance of a renewal of his licence; also, that when it has been thought necessary to take away a licence, a pet-

\* Report of 1816, p. 82. + *Ibid.* p. 117.

† *Ibid.* pp. 39, 40. § *Ibid.* p. 174.

tion from a brewer has altered the determination of the magistrates; and that under the influence of a brewer, who had a lease of the house, a licence was granted in a situation highly objectionable\*. Mr. Hanbury admitted that his house employed one of the clerks to the licensing justices as agent to forward the interests of the house, and Mr. Lush, a clerk in the police-office, Worship-street, for the same purpose†.

The facility with which some new houses have been licensed, against the wishes of their respective neighbourhoods, is strangely contrasted with the refusal of others unanimously petitioned for by the inhabitants in the vicinity‡; which plainly shows that considerations of public morals or convenience, do not guide the decisions of the magistrates. Mr. Rohde, a magistrate, says that there is difficulty in the Tower hamlets for any one to get a licence who has not a particular interest§; and the Rev. Mr. Robson, another magistrate, avows that if applications for two houses were to come before him, he should in preference be inclined to favour the interest alluded to.

So much for the restraint imposed by the licensing system on the multiplication of public houses:—Now for the regulation of the morals of those who keep and frequent them.

As to the guarantee for character supposed to be obtained by the certificate required at the hands of the publican, as a preliminary to his petitioning for a licence, it appears to be a common practice in the metropolis for the beadle of the different parishes, to obtain, for a small gratuity, the number of signatures required||; the certificate is then delivered to the high constable, and by him to the clerk of the justices, who, as we have seen, is, in some instances, the brewer's agent.

The high constable is usually a tradesman who receives no salary for a responsible and laborious office, and who is in general the friend or enemy of the publican, as he obtains, or fails to obtain, the publican's custom¶.

Then the monopoly and power which the licensing system throws into the

hands of the brewer, begets of itself an indifference to character in publicans, which their own interest would otherwise prevent. Mr. Adams says, he has observed in general a great difference in the conduct of a brewer's tenant, and that of the occupiers of free houses, the latter being more tenacious of character, *for upon that only can they depend*; whereas the tenant of the brewer is generally careless of reputation, as he trusts to the influence of his landlord in securing the continuance of his licence\*: his landlord is frequently a magistrate, and though the law prohibits his sitting on the bench on licensing days, yet his weight and authority is still there, and it is through his influence with his brother magistrates that he supports the credit of his houses.

It follows that these licensed houses, so far from affording any security for the conduct of those who frequent them, become in a great degree exempt from the control of the law. Mr. Platt says of the public houses in Bethnal-Green, that they are dreadful nuisances to the sober and decent part of the community, and that the Sabbath is profaned by scenes of riot and drunkenness†. Mr. Reynoldson, the constable, says, that several of the publicans in that parish have acknowledged to him, that in consequence of the number of public houses, they were compelled to allow of disorderly visitors and illegal practices; for there is not sufficient trade to keep them without‡. The constable, instead of presenting seven of these disorderly houses, was induced, at the request of the magistrate, Mr. Mercer, to present only one; but though he complained of the house being at all times full of company, boys and girls at late hours with cards and dice, the landlord gambling with his company, and insulting the parish officers, the licence was renewed.

There is, indeed, scarcely a single instance mentioned in the report, in which the licensing system has been taken advantage of for the suppression of immorality.

Mr. Beaumont, after stating that many of the public-houses in the Tower hamlets, are disorderly, and that the worst practices are allowed in them, adds, that not only no attempt has been made

\* Report of 1817, pp. 170, 171. † *Ibid.* 250.

‡ Report of 1816, pp. 96, 97, 98.

§ *Ibid.* p. 193.

|| Report of 1817, p. 158.

¶ *Ibid.* pp. 205, 156, 228, 256.

\* *Ibid.* p. 122. † *Ibid.* p. 268. ‡ *Ibid.* p. 277.

to put them down, but that when information has been tendered, it has been overruled\*. Mr. Markland, one of the magistrates at the Shadwell police-office, asserted, that if he should make a specific report to the magistrates against a public house, setting forth that it was the resort of thieves and persons of bad character, he did not think he should have more than his own vote for depriving the publican of his licence†. Mr. Gifford says,

"That it seldom happens that licences are taken away; that the facility with which licences are granted and renewed to persons of bad reputation and conduct, is highly injurious to the public morals; that he has long ceased to attend on licensing days, because he found little or no good resulted from such attendance, in refusing licences to infamous houses‡."

The case of the parish of Shadwell, as detailed in the unexceptionable evidence of Mr. Fletcher, shows

"That the most orderly and licentious conduct of the houses belonging to particular brewers does not insure the loss of the licence; but that if at last, from the notorious infamy of the parties complained against, the magistrates are compelled to interfere, the least possible punishment is inflicted, the tenant is shifted, a real or fraudulent transfer is made, and a new landlord takes possession to follow the old practices in the same house with aggravated misconduct: the maxim is, 'the house being brick and mortar cannot be guilty of any crime,' and the old system is revived with the same profit as before§."

It follows, therefore, that the licensing system, instead of acting in aid of public morals, affords a security to disorderly conduct, which could not otherwise be attained.

If the foregoing statement be true, and it rests in the main upon the most indisputable evidence—the admission of parties interested, before the highest tribunal in the land—the following positions seem to be pretty clearly established.

1. That the licensing system is productive of mischief in compelling the great body of the people to consume an inferior article at a higher price than that at which it could be vended under a system of free competition: in driving them to the use of ardent spirits; in exposing the publican to oppression, and rendering his property insecure.

2. That the system has failed altogether to repress disorderly and immoral conduct, either by limiting the number of public houses, (supposing such limitation to be desirable,) or by affording any check on the conduct of those who keep and frequent them; whilst, on the contrary, it encourages offence by securing impunity for offenders.

The original intentions of the legislature have thus been completely defeated, and the means pursued for a good purpose have so far produced nothing but evil.

But since the institution of this system, the state of society has been so greatly changed, that other considerations remain to be weighed before we can decide on the propriety of its entire abolition. One of these considerations, which seems very slightly to have engaged the attention of the committee, is the nature of our police establishments.

In England, we have not only no Preventive police, but the most rooted prejudice seems to exist among all classes, against any such institution. In such a state of things, all that can be done is to afford the actual police the best means that can be devised for the discovery and apprehension of offenders. The chief means which have hitherto presented themselves, have been found in the resort of the police officers to the public houses frequented by offenders,—their associating with such offenders there, and so becoming acquainted with their habits and persons; and if the licensing system have the effect of reducing the number of those haunts of vice, it of course narrows the field of police-superintendence, and renders it easier to the officers to discover and watch the different places of rendezvous.

Whether or not the licensing system affords any facilities in this way, the committee did not inquire, for they lament exceedingly, that criminals should be able to resort to any house of public entertainment; and that police officers should there associate with the criminals.

This opinion seems to have been formed upon little deliberation, and it is not easy to concur in it. The objection alleged against any public rendezvous for criminals, is, that though they may be apprehended in such places,

\* Report of 1816, p. 71. † *Ibid.* p. 120.

‡ *Ibid.* p. 88. § Report of 1817, p. 130—149.

"Crimes also there are planned; and that in these schools and academies for vice, adapted

to both sexes and to all ages, where one thief is seized, a hundred are trained to those courses, which, if it had not been for the legalized haunts of prostitutes and felons, the unfortunate individuals might not have been seduced to engage in\*."

Now, it will scarcely be expected that any efforts or regulations of police, however perfect, will prevail in the present state of society to suppress the existence of a considerable body of offenders.

It will scarcely be expected that any rigour of police should avail to prevent such persons from finding some place in which to assemble, and from enticing to their assemblages, young and inexperienced persons of both sexes. No machinery of police has ever succeeded in suppressing altogether assemblages of persons engaged in a common purpose: it may be assumed, that such assemblages will take place, either in secret, or openly.

But if we must have rogues, and rogues will meet somewhere, it is surely, for every object of police, better that they should meet openly than that they should meet in secret. In proportion as their haunts are known their apprehension is less difficult. In proportion, too, as these haunts are known they are branded with such a mark of infamy as is sufficient to deter from their threshold all that class of persons hovering between the confines of good and bad character: all that class for whom there is yet a *locus penitentiae*, and any opening or motive for a return to good habits. Many would resort to a secret meeting, accessible without the risk of—at least, immediate—discovery, who would shrink from the certain infamy which follows the entrance of the flash house.

As to the ordinary measures pursued by parish officers, and others of higher degree, for making offenders ambulatory; for simply removing them from one district to another; so long as offenders exist, little can be gained to the morals and happiness of this country by the nightly expulsion of wretches from the sheds of Covent-garden Market to the brick-kilns of Camden Town; or to the morals and happiness of the world, by a yearly expulsion of the same wretches from the shores of Great Britain to the shores of New South Wales.

The better policy would be to aim at establishing good laws and good judicial institutions; to aid them with an

effective police, and so to diminish the number of offenders, by increasing the certainty and proximity of punishment.

This brings us to the objection expressed by the committee to the intimacy between officers of the police and criminals—

"By which, in the opinion of the committee, under the disguise and pretence of furthering the detection of crimes and the apprehension of criminals, the guilty may be allowed to escape, the officers of justice exposed to dangerous temptations, and their character brought into great disrepute\*."

Undoubtedly, under such a plan of police, the guilty may be allowed to escape, and the inferior officers of the police will probably not stand in very high repute. But these inconveniencies are less than the evil of letting *all* the guilty escape; and what other plan is there by which *any* can be taken, except in the small number of instances in which they are caught in the act of perpetrating the crime? By knowing the accustomed haunt of the thief, the thief-taker knows when he has been absent, and upon the perpetration of any offence has an immediate clue to the person of the offender. We must take the means as we find them, and content ourselves with lessening, as far as in us lies, the inconveniencies with which they may be accompanied. These inconveniencies, however, do not appear to be very serious, and the weightier of them it will not be difficult to avoid.

As to the reputation of the subordinate officers of the police, it can never be expected to stand very high, considering the disagreeable nature of their functions, and the aversion which every respectable man must feel to be engaged in them; but as to the possible facilitation of escape to offenders, from the circumstance of the officer's being in habits of intimacy with him, that may perhaps be obviated.

To repose confidence in honour and integrity where they can be scarcely expected to have existence, would be justly ridiculed; but it might not be insuperably difficult to render the interest of the officer compatible with his duty. When it is once clearly the interest of the officer that the offender should not escape, we may rest pretty secure, that in the long run intimacies will not prevail against interest, and then it only remains so to guard the interest as that it may not lead

\* Report of 1817, p. 17.

\* *Ibid.* p. 17.

to the apprehension of the innocent; an object, perhaps, of difficult, but by no means of impossible attainment.

Assuming it to have been established by the foregoing arguments, that so long as offenders exist, it is not inexpedient that they should resort to certain public places of rendezvous, and that the officers of the police should there become acquainted with their persons and habits, would the abolition of the licensing system have a tendency to multiply such places of resort, and thereby render it more difficult for the police to discover and watch them?

If it would, it does not appear how the licensing system could be abolished without destroying the little efficacy which the police now possesses.

If it would not, there does not seem to be a single argument in favour of the licensing system.

It is clear from the evidence before the committee, that the number of public houses,—especially in districts where the flash houses most abound, and the population is most depraved,—is already greater than is compatible with the ordinary profits of trade, without resorting to a discreditable way of carrying on the business.

It is equally clear, from the same evidence, that but for that creature of the licensing system, the influence of the great brewers, which supports the publicans in their improper courses, a much smaller number of them would be enabled to carry on a discreditable traffic. Publicans, independent of the brewers, must, in by far the greater proportion, conduct themselves properly from apprehension of the ruin consequent on punishment; whereas a publican dependent on a brewer may set character at naught, and may be guilty of every kind of misconduct without incurring the risk of punishment or check.

Assuming that without recourse to discreditable conduct, so many publicans could not carry on their trade, as are enabled to carry it on by a recourse to such conduct, it seems indisputably to follow, that if the number of those who can carry on the trade discreditably, be diminished, the number of public houses will at least not be increased.

But admitting that the abolition of the licensing system would double or treble the number of public houses, it by no means follows that it would in-

crease by a single unit the number of flash houses; on the contrary, as there would be no publicans who could rely on the brewers for protection, notwithstanding their bad conduct; as the greater proportion of them would have an interest in establishing and maintaining a character for good conduct, lest by exposing themselves to punishment they should expose themselves to ruin, it is difficult to suppose that the number of flash houses would not, under such circumstances, be smaller than at present. Upon the reduction of the duty on coffee, numerous coffee-houses sprang up all over London, without licence, for the accommodation of the poorer classes, and were and are very numerous frequented; but among the whole number, not above two or three became flash houses, and these are well known to the police.

That the mere increase in the number of public houses without an increase in the flash houses, would be an evil, it is difficult to conceive. At present it seems impossible, even in the country, to refuse at least one house of public entertainment in every parish; and though some might wish that there should be not even one, yet if one be allowed, it is not easy to see what can be the objection to two or more. With regard to morals it can make no great difference whether twenty persons be congregated to drink bad beer in one house, or twice ten to drink good beer in two: in the division of the party there is rather advantage than not.

With regard to the temptation to drink, that must depend on the amount of money and time which the drinker has at command, and upon the state of his ideas and habits;—not on the number of alehouses. Increasing the number of alehouses will not increase the amount of his means, and if he have the means already, the gratification may be obtained as well at one alehouse as at twenty. There is reason to think, however, that in proportion as they are numerous, the centre of attraction will lose its power; and that if every other house were a house of entertainment, people would be as sober as they are where every other field is a vineyard, and for the same reason. Whatever of easy attainment ceases to be an object of intemperate desire.

To the abolition of the licensing

tem, there still, however, remains an obstacle, which, though not avowed nor avowable, is perhaps the *only* obstacle of difficulty;—the influence of the monopolist brewers.

Upon any intelligible scheme of justice or benevolence, there can be no doubt that the interests of fourteen or fifteen millions of people ought not to be sacrificed to the interests of fourteen or fifteen, or forty or fifty brewers. If one of the two parties *must* suffer inconvenience and loss, the suffering ought to fall where it will be least in amount. But our legislators belong to the class of the rich, and their sympathies naturally lean to the class in which they move. It is much to be apprehended, that the sufferings of the princely brewers will, in the estimation of a legislature so constituted, greatly outweigh the sufferings of the rest of the community. We have it on the authority of Dean Andrews, that a breach of the law is a matter of very little importance, where only "*ale-drinkers*" are affected by it\*. The sufferings and loss of the brewers, however, it is possible to mitigate by the time and mode of any proposed alteration. The measure may be prospective, and the brewers may have sufficient notice gradually to withdraw their capitals from the pernicious monopoly of licensed public houses.

It seems difficult to effect any useful reform without abandoning those licences. So long as they are continued, it will be impossible to prevent them from becoming in effect the property of opulent individuals; and so long as they are the property of opulent individuals, it would be idle to expect any cessation of the evils which they now occasion.

Supposing the licence,—that is, as far as the magistrate's consent is concerned,—to be abolished, we should still have even in the common law, more completely than in the licence, assuming it to be honestly withheld, a security for the correctness of the publican's conduct, and the due regulation of his house. In point of fact, the licence, as it has been shewn, so far from operating as a security for good conduct, has had an opposite effect, and has afforded incitement and impunity to bad. But if it had been employed for proper purposes, it could only have been brought to bear against the publican once a year;

whereas, by the common law, he might — if his house were a nuisance to the neighbourhood, or were kept in a disorderly manner — be presented, indicted, and punished at the quarter sessions, in the country four times, and in London eight times in the year; and by statute, he might be summarily punished by fine.

In a few words, therefore, all that is wanting in the way of change, is—to divest the magistrates of the control they now exercise, preliminarily to the publican's taking out a licence at the excise: in other respects, to leave their power over the conduct of the publican what it is at present, both by statute and at common law;—or even, if it be thought necessary, to increase that power by subjecting publicans to heavier penalties: but to take away the control of the magistrate over the licensee, because that licence becomes virtually the property of the brewer;—because the brewer has thereby a motive to control, and from his opulence and power is enabled to control the magistrate;—and because by exercising such control over the magistrate, he is enabled to establish a monopoly which compels the people to drink bad beer, which drives them to the use of ardent spirits, and which, while it secures the publican from punishment for misconduct, often subjects him, when innocent, to the most ruinous insecurity of property.

To abolish this monopoly, and completely to carry into effect the intentions of the legislature, with regard to the morals and habits of the people, which the magistrate's control over the licensee has so entirely frustrated, some such regulations as the following, would appear expedient: viz.

That every man who has obtained the excise-licence should be at liberty, without the consent of magistrates, to open a public house upon condition of finding two sureties in 150*l.*, instead of 20*l.*, as at present, to answer for any fines which he might incur for misconduct permitted in his house:

That, upon proof of riot or tumult under his roof, or of intoxication so noisy as to disturb his neighbours, he should be convicted (as by 3*rd* Geo. IV. c. 77) by a single magistrate, in a penalty not exceeding 5*l.* for a first offence, and 20*l.* for a second:

\* See Parl. Papers, 1816, No. 179. 2.  
SESS. 1826.

That, for a third offence, he should (as under that act) be bound over to appear at the quarter sessions, and if convicted there by a jury, be fined in any sum not exceeding 100*l.* and be disabled to keep a public house for three years:

That he should be appointed a special constable in his own house, with power to turn out or reject such guests, with the exception of police officers, as he might deem objectionable:—(Against any abuse of this power his own interest would be a sufficient security; while the possession of it would deprive him of all excuse for permitting disorderly conduct:)

And, lastly, that, with a view to the ready superintendence of the police, he should be compelled to keep his doors open so long as he had any company in his house.

Considering that Mr. Peel has signified his intention of taking this matter in hand, it may perhaps be deemed somewhat presumptuous to have offered these suggestions by way of conclusion. In his intelligence we have full confidence, and believe that if any man *can* overlook the influence of the brewers, and establish a better claim for our respect, than the licensing magistrates, Mr. Peel will do it.

#### *Bankrupt Laws:—(Debtor and Creditor Arrangement Bill.)*

If it could be satisfactorily shewn that under the best possible plan for a distribution of the property of an insolvent among all his creditors, the process of distribution must, in the majority of instances, consume the whole, or the greater portion of the property, there might be good reason for concluding, that a system of bankrupt law is productive of more harm than good; that it would be better that the property should be preserved, even by a preference of a particular creditor to the exclusion of the rest, than that it should be dissipated among lawyers and witnesses; and that credit should derive all its confidence and security from the caution of the creditor, and the character of the debtor. Nothing but a parliamentary return, shewing the expenses and assets upon all commissions of bank-

rupts for two or three years, could set this question at rest.

Although, however, doubts may be entertained on the subject, we shall assume for the purposes of the present inquiry, that a law for the distribution of the estate of an insolvent person, among all his creditors, is a useful institution. If so, among the good effects of such a law, may be reckoned its tendency to promote at once liberality and caution in every individual trader:—liberality as a creditor, by affording him the security of a rateable proportion of his debtor's property;—caution as a debtor, by rendering dishonesty penal and unavailing.

In order to effect a distribution of the estate of an insolvent for the benefit of his creditors, provision must be made for its preservation by an immediate transfer to the distributor:—for the gradual collection of debts and outstanding effects:—for the conversion of the whole estate into money, and its subsequent distribution:—and the excellence of laws enacted for the purposes in question, will depend upon the degree in which they are adapted to effect it, by these several stages, justly, expeditiously, and cheaply. The release of the insolvent, which should follow as the natural consequence of the surrender of his effects, though not materially involved in the present inquiry, will be shortly adverted to, towards the close.

For the purpose of preserving and getting in the effects, it is obvious, that provision must be made for the immediate transfer of the property in them, and for ensuring speedy possession. A law, merely directing the mode of distribution, even though guarded by penalties for its violation, would, unless it were available to effect such transfer of title and power of seizure, be inefficient. But powers are also necessary for summoning, apprehending, and examining the insolvent and his co-creditors, or others, suspected of concealment or mal-practices, in relation to his estate and dealings. Compulsory process in all these matters must form an indispensable ingredient of any efficient bankrupt law.

Cases may undoubtedly occur, in which compulsory powers may not be called into action; but, in framing a general law, nothing short of such an authority over property and person,

will meet the exigency of the greater number of cases, or countervail the dangers to which insolvent estates, from fraud, improvidence, or adverse proceedings, are ordinarily and notoriously exposed.

With a view to the distribution of the effects, when realized and turned into cash, whoever administers the law, must possess authority and knowledge sufficient to inquire into and determine the validity and legal effects of contracts and securities, in all their various forms,—to adjudicate upon disputed rights of action,—to unravel and adjust the conflicting interests of different parties, and ultimately to allow or disallow the several claims upon the estate. There can be no complete code of insolvent law, without such powers. Extensive and important as they undoubtedly are, yet the exercise of them all, occasionally at least, is necessarily involved in a system intended to effect an absolute transfer of all the rights, interests, and property of the insolvent, the transmutation of the whole into money, and a speedy and equal distribution of the proceeds among his *bonâ fide* creditors.

Economy and expedition are also of the essence of this branch of the law, since deficiency in this respect has a direct tendency to defeat the primary object of rendering the estate as productive as possible, for the relief and satisfaction of creditors.

It must be recollected, however, that in the usual circumstances of an insolvent trader's affairs, considerable time and labour are requisite for the purpose of a final division of effects. Debts must be got in, often by legal process, accounts must be settled, claims to outstanding property enforced, differences adjusted, securities valued, effects sold, the entire estate converted into a divisible fund, the aggregate amount chargeable upon which must be ascertained by an investigation of each particular claim, actual division and payment must be made, and the general account finally balanced and closed. This detail of particulars is applicable to the ordinary case of a retail home-trader, carrying on business to a moderate extent, and involves in it no such special circumstances as commonly attend foreign correspondences and dealings, complicated partnerships,

or several sets of partners, nor any of the intricacies and difficulties created by fraudulent concealment and perjury. Such more involved cases, however, are of frequent occurrence, and require in their management every aid that can be derived from the interposition and authority of the law.

From this cursory statement, it may be inferred, that the subject under review, comprises matter of legislation too important, complex, and extensive, to be efficaciously dealt with by enactments, or a method of procedure, affecting great brevity and simplicity; that persons possessing responsibility of character, habits of business, and a respectable proficiency in the science and practice of the law, are the only fit agents to be intrusted with the requisite authority for carrying the purposes of the legislature into execution; that every insolvency will call for a considerable sacrifice of their time and attention; and lastly, that for the bestowing of these, (which, to such men, are the chief sources of income and property,) they must be adequately remunerated.

Admitting that the honest assent and co-operation of the debtor must facilitate the end proposed, yet, with a view to cases in general, it would never be safe to omit precautionary enactments, or to confer less ample authority: for, first, professed honesty of intention is no security against actual fraud, for which, on the contrary, it may be used as a cover; and next, in respect of debtors to, or claimants upon the estate, and in respect of outstanding effects and interests, available, or that ought to be available, for the benefit of the creditors, the case is not materially varied by the concurrence or contumacy of the insolvent, depending less upon *his* demeanour, than that of the other parties: the same powers are therefore necessary in relation to persons and property, whether the insolvent be a willing party, and conduct himself uprightly towards his creditors, or not.

Having premised thus much, we proceed to examine briefly, the general scope and character of a bill which was pending in the House of Lords at the dissolution of the last parliament, intitled, "An Act to facilitate arrangements between debtor and creditor." The measure was introduced in the

lower house, with the professed intention of removing the obstacles caused by the Bankrupt Laws to the settlement of insolvencies, by mutual assent of debtor and creditor; and of furnishing a remedy for the alleged inefficiency and expensiveness of the bankrupt system.

The bill appears to have been originally framed under an impression, that the subject is capable of being disposed of, and the end attained, by a concise and simple method, divested of the minute and manifold provisions of the statutes of bankruptcy. That we are justified in attributing this impression to the framer of the bill now under review, will be manifest to any one who will be at the pains of reading it in its original form; for it was only after frequent discussion and comment had unfolded something of the true nature and difficulties of the subject, that the bill swelled out into its present comparative fullness and complexity.

If it shall be shown in the course of the ensuing paper that any unnecessary expense and delay incurred under the English bankrupt law in the distribution of the property of an insolvent person, is occasioned not by the substantive enactments of that law, but by abuses or ill-judged provisions which have crept into the details of its execution, it will follow that, as a remedial measure, the bill of last session is misconceived, being intended, not to correct errors in the administration of the bankrupt law, but to introduce a substitute, which, as far as it should operate, would supersede it. But the proceedings under the new bill would be, at least as much, probably more expensive, than proceedings under the established bankrupt law; while in its details, the bill is utterly defective, and inadequate to the accomplishment of its professed purposes.

With reference to the comparative expense of the management of an insolvency, under a commission of bankrupt, and under the provisions of the new bill respectively, let us take the case of a home trader, of moderate property and business, and without any real estate; the total expense, under a commission for such a case, will average below 120*l*. Let us suppose a similar case under the provisions of the new bill, in which the number of creditors shall be twenty; there shall be three meetings, the trust deed shall be ninety

folios in length, a solicitor and an accountant shall be employed, an arbitrator shall be appointed, and a release shall be executed to the trustees. Here, be it observed, that the supposed number of meetings is the least possible;—there are no freeholds, which, if there were, would greatly increase the expense, as additional deeds would be required; and every thing is presumed to proceed regularly, without fraud or litigation;—let it be supposed in addition, that the arbitrator is allowed the lowest sum prescribed by the act; that the accountant's charge is 20*l*., which is much below the usual amount in such cases; that the solicitor's bill is unexceptionable, and that the only application to the Court shall be by petition, as directed by the act, for the appointment of an arbitrator. It is evident, that many charges are here omitted which, in a majority of cases, will be to be added; yet the expense, thus calculated, will amount to no less than 130*l*.

The particular enactments of the bill which chiefly demand attention, are those which relate to the execution of the trust deed, the constitution and powers of the meetings of creditors,—the appointment, powers, and duties of the trustees, and of the arbitrator,—the jurisdiction of the Courts of Equity, and the protection and discharge of the debtor.

In relation to the trust deed, the enactments are in substance—That no deed executed by any trader liable to the bankrupt laws, whereby all his estate and effects shall be conveyed in trust for the benefit of all his creditors, shall be an act of bankruptcy, if executed by nine-tenths in number of creditors of 10*l*. each, being creditors to the amount of nine-tenths of the whole of his debts; provided such deed shall have been so executed or assented to in writing, within three calendar months from the first signature. And if, within fourteen days of the first signature, notice shall be published in the Gazette and two newspapers, that the deed has been in part executed, then the same is to be binding, as soon as executed by the prescribed proportion of creditors. To prevent doubts as to the due execution of the deed, the trustees and trader may make affidavit before a justice of the peace, that, to the best of their knowledge and belief, the specified proportion of the

creditors had executed before the trustees had notice of any proceeding at law or in equity, calling in question the deed, or any proceeding under it; and then, after inserting a copy of the affidavit in the Gazette and two newspapers, the deed shall be deemed to have been duly executed, unless some such proceeding at law or in equity shall be commenced within six calendar months after such insertion in the Gazette, &c. and unless such proceeding be duly, and without unnecessary delay, effectually prosecuted; and it is afterwards provided that, if any doubt arise touching the execution of the deed, and no arbitrator shall have been appointed, the trader, or any creditor or trustee under the deed, may petition the Chancellor or other judge in equity, who is to hear such petition in a summary way, and make such order as he shall see fit. A separate clause provides, that the act shall not extend to any such deed of trust executed by *all* the creditors.

These provisions are framed upon the supposition, that the accession of the requisite proportion of creditors may not be procured within a less period than three months. During this time, the property, instead of being secured as under the bankrupt law, by an immediate transfer to the assignee, is under no effectual control or protection; the trustees are incapable of enforcing any claim, of resisting hostile proceedings, or of conferring a legal title; and it remains all the while doubtful, whether, after much expense and delay incurred, the measure will not in the event prove abortive, by the intermediate dissipation or seizure of the estate, or for want of a sufficient number of signatures.

Then the provision as to the proportion of creditors required to give effect to the deed, is so difficult of application, and so little susceptible of that certainty, which, in such a case, is the prime requisite, as to present a fruitful source of embarrassment and litigation, and consequent waste of effects, and disappointment to the creditors. The probability of the occurrence of such evils was too manifest to be overlooked; and accordingly, by a clause, the substance of which is given above, an attempt is made to obviate them. The remedy offered, however, is not only very imperfect and inadequate to the occasion—inasmuch as it is no bar to litigation until after

the expiration of six calendar months—but is highly objectionable in principle, because, after assuming the existence of doubts upon a fact, (namely, the precise amount in number and value of the creditors,) which cannot ordinarily be within the knowledge of the trustees, and with whom therefore it must be for the most part matter of uncertainty, it is nevertheless put to them to make oath for the solution of those doubts, that, to the best of their knowledge and belief, they are unfounded. If it be alleged that there is no better method, this only confirms the objections to the entire plan. But be the provision never so unexceptionable in itself, it is rendered entirely nugatory by the subsequent section, (unless we totally mistake its meaning,) whereby it is expressly provided, that the due execution of the deed may be called in question at any time, and determined by the arbitrator, or, if none be appointed with sufficient powers, by a Court of Equity. Whether the basis thus laid for the speedy, cheap, and beneficial arrangement of an insolvent's affairs, promise much for the attainment of that desirable object, we leave the reader to judge.

The clause by which assignments in trust, executed by *all* the creditors, are excluded from the operation of the bill, exhibits a further instance of unskillfulness, and want of consideration. It is true, that no law was necessary to declare that such a deed, so executed, should not be an act of bankruptcy; but why withhold from it the benefit of those powers of examination, and other privileges, which are not less beneficial when the whole, than when only a part, of the creditors are concurring. To secure the concurrence of all, would seem to be the crowning point, and perfection of the plan; and to make that the immediate occasion of denying advantages, conceded in less advanced stages of concurrence, is surely a strange anomaly in legislation.

With respect to the meetings of creditors,—they are required to consist of those who have signed or assented to the trust deed, and may be convened by the trader, or by three or more creditors, or any trustee; each creditor to have seven days notice at the least, and not more than fourteen days; and all questions to be decided by a majority of those

present, such majority, when voting for the removal, confirmation, or appointment of trustees, not being less in number than half, and, in all other cases, than one third, of those who have executed or assented to the deed. After the direction for serving notice on the creditors individually, a clause is inserted, providing that notice of any general meeting, inserted in the Gazette and two newspapers, ten days at least, and not more than fifteen days, before the meeting, shall be sufficient. Any creditor may be required to make affidavit of his debt, in order to entitle him to vote. After any general meeting under the act, all previous meetings are to be taken to have been duly held, unless there shall be a complaint by any creditor of his having been absent for want of sufficient notice; which complaint is to be heard and determined by the arbitrator, or, if none, by the Lord Chancellor, or other judge in equity, upon petition. The orders and resolutions of each meeting are to be inserted in a book to be kept by the trustees.

The acts which general meetings of creditors are empowered to do, are, to confirm the trustees named in the deed, or to remove them and appoint others—to call for and investigate the trustees' accounts—to petition the Lord Chancellor, or other judge in equity, to appoint an arbitrator, and to consent to his being invested with power finally to determine all matters relating to the insolvency; and to assent to a petition to the Lord Chancellor that the execution of the deed by the trader may be declared an act of bankruptcy. And such matters as shall be agreed by the prescribed majority at any general meeting, are to be binding upon all persons who shall be bound by the deed.

It is scarcely necessary to observe, that the regular exercise of the powers thus vested in the meetings of creditors, is essential to the attainment of the general object of the law; and that, therefore, their legal right and competency to act, ought to be unquestionable.

Now there are chargeable upon the plan, for the formation of these meetings, two radical defects. In the first place, the validity of all the acts of the general meetings depends upon the concurrence of a constituted majority, having relation to the total amount, as well in number

as value, of the *bonâ fide* creditors of the insolvent; consequently, as long as such total amount remains unascertained, every act of every general meeting will be liable to be called in question, and set aside, in any stage of the proceedings, by the discovery of new debts, or the reduction of old, on the ground of error or fraud. And it is no answer to point to the clause before referred to, empowering the trustees and trader to make oath as to the due execution of the deed, because that is an optional act, and inoperative, at all events, for six months.

In the next place, as it must always be a matter of uncertainty, whether the prescribed majority in number and amount, supposing it to be ascertained, will attend; and as the acts to be done by the general meetings must be agreed to by such majority, or left undone; the proceedings, after execution of the deed, may be stopt *in limine*, or rendered abortive at any subsequent point, at which the concurrence of a general meeting may be required. Meetings of creditors, it is well known, are seldom fully attended, and, not unfrequently, do the attempts to convene them wholly fail. Even the obvious expedient of admitting votes by proxy, under powers of attorney, is here omitted.

With relation to the trustees and arbitrator, the bill provides, that at a general meeting, the trustees named in the deed may be confirmed or removed, and in case of removal new trustees appointed. The trustees, when appointed, may execute powers vested in the trader; sell and convey his estates, institute and defend suits, &c.

An arbitrator may be appointed by the Lord Chancellor, or other judge in equity, upon petition from a general meeting; and, if so expressed in the petition, may, at the discretion of the Lord Chancellor, have full power finally and without appeal, to determine all matters relating to the administration of the insolvent's affairs. For his services he is to be paid, by order of the Chancellor, &c., upon the trustees, not less than 10*l.* nor more in addition than 1*l.* in every hundred of the amount paid to the creditors. The trustees or arbitrator are empowered to examine the trader on oath, from time to time, touching his property, and to call upon

any creditor, or claimant, against the estate, to prove his debt upon oath, and, if he fails so to do within two months, his debt is to be disallowed or cancelled.

It by no means distinctly appears, what are the respective concurrent powers of creditors, trustees, and arbitrators, or whether, by the appointment of an arbitrator, the office of the trustees, and the controlling authority of the general meetings, are absolutely or in any measure superseded. This defect is calculated to introduce great confusion.

But by the original confirmation, or removal and new appointment of trustees, the power conferred by the bill in this behalf is exhausted; and whatever exigency may afterwards arise in consequence of death, resignation, misconduct or inability to act, is wholly unprovided for; leaving a source of disorder more prolific than the other.

With respect to the arbitrator, the conferring upon such an officer absolute power, without appeal from his decisions, particularly when it is considered to what an extent collateral interests may be involved, seems scarcely compatible with the due security of those interests. Such a degree of authority tends to produce carelessness and abuse of power in the party entrusted with it, and if he err, the bad effects of his errors are perpetuated without remedy. The compensation to the arbitrator, except perhaps in cases of so small extent as not to require his aid, is not commensurate with the expenditure of time and labour necessary to the faithful discharge of his duties; and if so, he is placed under manifest temptation to an arbitrary, precipitate, and slovenly manner of proceeding.

While, on the one hand, it is proposed to invest the arbitrator with uncontrolled powers of adjudication, on the other hand, the power of examination, which, in order to answer its purpose, ought to be full and extensive, is left in several respects insufficient: not only the trader himself, and his creditors and claimants upon his estate, but his debtors, and all persons suspected of being debtors, or of any fraud or concealment in respect of the estate and affairs of the insolvent, ought to be liable to be brought up and examined. And further, the right to examine, in order to be effectual, ought to be accompanied with the power of compelling by penalty explicit answers

to lawful questions; whereas by the bill, no persons but the trader and creditors and claimants against the estate, are subject to examination, and there is no power to compel explicit answers even from them. It is only in case of perjury actually committed, or of refusal on the part of the trader to be examined upon oath, that any penalty attaches; and then not in the way of enforcing submission, but of punishment for a past offence.

The clauses of the bill which provide that recourse may be had to the Courts of Equity, apply to almost every stage of the proceeding; to the appointment and remuneration of the arbitrator—to the deposit of money by the trustees—to their ultimate release—to the distribution of accruing assets in case no arbitrator be appointed—to various complaints of creditors, in like case—to adjudging upon petition the execution of the deed to be an act of bankruptcy—to frauds committed by the insolvent—to all doubts that shall arise in respect of the due execution of, or assenting to the deed, the due appointment, confirmation, or removal of any trustee, or the conduct of any trustee, or the due delivering up of documents by any trustee who has been removed—to the due execution of any of the powers of the act, or the management and administration of the affairs of the trader, where no arbitrator, having sufficient powers, has been appointed.

The only observation it seems necessary to make upon these provisions for resorting, at almost every turn, to the Courts of Equity, is, that whatever may be their merit in other respects, they are but little in harmony with the principal object of the proposed new law, considered as a substitute for the bankrupt law, namely, economy of money and of time.

The protection and discharge of the insolvent, and the punishment of fraud committed by him, remain to be noticed.

The protection afforded to the insolvent by the provisions of the bill is very imperfect, as it is only to operate from the due execution of the deed by the full proportion of creditors, which, as we have seen, may be deferred for three months; and after that, must remain subject to whatever uncertainty may attach to the validity of the deed itself, and the proceedings under it.

suing it out, suppose it delivered into the hands of the three acting commissioners, of whom one at least, is required to be a barrister: after taking the prescribed oath for the faithful discharge of their duties, and having ascertained by evidence upon oath, that the insolvent comes within the description of persons amenable to the bankrupt laws, that the petitioning creditor is competent in respect of his debt to sue out a commission, and that the party has actually become bankrupt,—they adjudge him so accordingly. From that moment the custody of the law attaches upon the whole of his property, taking effect from the time of his bankruptcy, (except as to effects transferred *bona fide* as above mentioned); and a warrant of seizure is executed by the commissioners, under which all that is tangible and moveable is reduced to actual possession. If the bankrupt thinks fit, he surrenders forthwith, and thus obtains immediate protection from arrest, until his final examination. For the discovery of concealed effects, the elucidation of doubtful claims on the part of the bankrupt, and other purposes auxiliary to the proceedings, the commissioners are invested with full powers to summon—to apprehend (if necessary)—to examine upon oath—and to commit for falsehood or prevarication, or refusal to answer lawful questions, all persons suspected of concealment or fraud, or supposed to be capable of affording material information; subject, however, to a right in the party committed to be called up and re-examined upon his own application, or to appeal against the commitment to the Lord Chancellor, who is authorized to remand or discharge him. The power of the commissioners is thus sufficiently guarded from abuse; and that its abuse is an event of rare occurrence, may be proved from the history and result of the various applications by way of appeal to the Chancellor for many years past; a large proportion of the applicants having been remanded, and most of the others discharged, not upon the merits, but for defect of form in the warrant. On the other hand, this power has been the successful instrument in innumerable cases, of exposing and defeating deep-laid machinations or defrauding credi-

tors, and of preserving and recovering property to large amounts. Every such instance, is a proof that the powers in question are well adapted to the purposes for which they are given,—purposes, which could not be effected by less efficient means, nor by a jurisdiction otherwise constituted in any material respect, than that of commissioners of bankrupt. The assignees, when appointed, are clothed with the legal title to the bankrupt's property, and with all requisite powers for getting in the effects, and conducting the affairs of the bankruptcy, subject to the authority of the commissioners, to whom they must account upon oath. Ample facility, as to time and arrangement, is afforded for the proof of debts; and undue procrastination is guarded against by the appointment by statute of days for taking proofs, for auditing the assignees' accounts, and for declaring a dividend.

In order to qualify himself for receiving his certificate of conformity, (which is the act of the commissioners, assented to by a certain proportion of the creditors, subject to the confirmation of the Chancellor, and constitutes the bankrupt's release from debts, proved or proveable under the commission), he must, on his final examination, swear to the truth of his accounts, and to the fact of his having made a full disclosure and surrender of all his property and effects.

Any party thinking himself aggrieved in the course of the proceedings, may carry his complaint before the Chancellor in a summary way, by petition, and, if entitled to it, obtain his order for redress, according to the circumstances of the case.

If the bankrupt fail to surrender himself for examination, on or before the forty-second day after notice in the *Gazettes*, or falsify upon his last examination, or conceal or embezzle property to the value of 10*l.*, he is guilty of felony; and liable, on conviction, to be transported for life, or for a less period, or to be imprisoned, at the discretion of the court.

All classes of creditors whose debts are capable of being reduced to a certain certainty, are put upon an equal footing in respect of the proof of the dividend.

code, however, in many particulars, still needs revision and improvement.

One is, that the operation of the bankrupt law is confined within too narrow limits. This was particularly the case before the passing of the present act, in two respects; first, by restricting the liability to bankruptcy to certain descriptions of traders; and next, by the prohibitory rule by which an individual was prevented from being any way actively or voluntarily instrumental in prosecuting his own commission. These restrictions have, in the recent act, been in a great degree abandoned, by making all traders (with a very few exceptions) liable to the bankrupt law; and by the introduction of a clause, the most beneficial and important of the recent improvements, under which any such trader is empowered to file a declaration of insolvency at the bankrupt office; whereupon, after due notice in the Gazette, a commission may be sued out by any creditor, with or without the concurrence of the bankrupt. Thus, a trader who may become unable to fulfil his engagements, may lawfully and without subterfuge or deception, adopt the course which an upright intention towards his creditors, and a prudent regard to his own future interests, alike recommend. There seems, however, to be no reason why the facility thus afforded, might not be extended as far as the relation of debtor and creditor, without reference to trade or calling. For, admitting that persons not in trade may properly be protected from liability to adverse commissions, why should they be prohibited from following the dictates of integrity and discretion, in a way the most conducive to the interests of their creditors, and their own ultimate relief?

Then the limitation, as to time, ought to be withdrawn from the clause by which "conveyances, contracts, and other transactions, by and with any bankrupt, *bonâ fide* made and entered into, and executions and attachments against his lands or goods, *bonâ fide* executed and levied, more than two calendar months before the issuing of the commission, shall be valid, notwithstanding any prior act of bankruptcy, provided the party had no notice of any such prior act."

This clause is founded upon the act of 1826.

mitted and undeniable principle, that the innocent party described, ought not to have his dealings disturbed by a commission resting on an act of bankruptcy, of which he had no knowledge at the time of the dealings; but how is the case affected in point of principle by the period at which the commission issues? The exception as to commissions issued within two months of such an act of bankruptcy, is in direct contradiction with the reason upon which the rule is founded; the rule, therefore, so qualified, is, in principle, inconsistent with itself, as well as with the section immediately succeeding it, whereby payments by and to the bankrupt, *bonâ fide* and without notice, are protected, as they ought to be, unconditionally. It may be alleged in defence of the provision in question, that a party seldom becomes the subject of a commission of bankruptcy, without exhibiting within two months previously, indications of deranged and insolvent circumstances, sufficient to put any prudent man upon his guard: but the fact is frequently otherwise; and at all events, there seems to be no reason why the question of *bonâ fides* and want of notice, should not as well be inquired into, and made the test of validity with regard to transactions which have occurred within the two months, as beyond that period.

The expense of a commission of bankruptcy, as compared with the proposed new law, has already been shewn. It may, however, be admitted, that there are cases in which the necessary expenses are somewhat disproportioned to the amount of property involved, and the time, skill, and labour called for in conducting them. But it is scarcely possible to preserve an exact proportion, in this respect, in each individual case: the calculation of reasonable remuneration must go upon an average of cases in general, in which, the allowed charges are unexceptionable. And the cases in which the expense would be disproportionate, have been considerably diminished in number, by the operation of the acts for the relief of insolvent debtors.

But in considering the general character of the system, it may be useful shortly to trace the usual course of proceedings under a commission. Passing by the formalities attending the

suing it out; suppose it delivered into the hands of the three acting commissioners, of whom one at least, is required to be a barrister: after taking the prescribed oath for the faithful discharge of their duties, and having ascertained by evidence upon oath, that the insolvent comes within the description of persons amenable to the bankrupt laws, that the petitioning creditor is competent in respect of his debt to sue out a commission, and that the party has actually become bankrupt,—they adjudge him so accordingly. From that moment the custody of the law attaches upon the whole of his property, taking effect from the time of his bankruptcy, (except as to effects transferred *bond fide* as above mentioned); and a warrant of seizure is executed by the commissioners, under which all that is tangible and moveable is reduced to actual possession. If the bankrupt thinks fit, he surrenders forthwith, and thus obtains immediate protection from arrest, until his final examination. For the discovery of concealed effects, the elucidation of doubtful claims on the part of the bankrupt, and other purposes auxiliary to the proceedings, the commissioners are invested with full powers to summon—to apprehend (if necessary)—to examine upon oath—and to commit for falsehood or prevarication, or refusal to answer lawful questions, all persons suspected of concealment or fraud, or supposed to be capable of affording material information; subject, however, to a right in the party committed to be called up and re-examined upon his own application, or to appeal against the commitment to the Lord Chancellor, who is authorized to remand or discharge him. The power of the commissioners is thus sufficiently guarded from abuse; and that its abuse is an event of rare occurrence, may be proved from the history and result of the various applications by way of appeal to the Chancellor for many years past; a large proportion of the applicants having been remanded, and most of the others discharged, not upon the merits, but for defect of form in the warrant. On the other hand, this power has been the successful instrument in innumerable cases, of exposing and defeating deep-laid machinations or defrauding credi-

tors, and of preserving and recovering property to large amounts. Every such instance, is a proof that the powers in question are well adapted to the purposes for which they are given,—purposes, which could not be effected by less efficient means, nor by a jurisdiction otherwise constituted in any material respect, than that of commissioners of bankrupt. The assignees, when appointed, are clothed with the legal title to the bankrupt's property, and with all requisite powers for getting in the effects, and conducting the affairs of the bankruptcy, subject to the authority of the commissioners, to whom they must account upon oath. Ample facility, as to time and arrangement, is afforded for the proof of debts; and undue procrastination is guarded against by the appointment by statute of days for taking proofs, for auditing the assignees' accounts, and for declaring a dividend.

In order to qualify himself for receiving his certificate of conformity, (which is the act of the commissioners, assented to by a certain proportion of the creditors, subject to the confirmation of the Chancellor, and constitutes the bankrupt's release from debts, proved or proveable under the commission), he must, on his final examination, swear to the truth of his accounts, and to the fact of his having made a full disclosure and surrender of all his property and effects.

Any party thinking himself aggrieved in the course of the proceedings, may carry his complaint before the Chancellor in a summary way, by petition, and, if entitled to it, obtain his order for redress, according to the circumstances of the case.

If the bankrupt fail to surrender himself for examination, on or before the forty-second day after notice in the Gazette, or falsify upon his last examination, or conceal or embezzle property to the value of 10*l.*, he is guilty of felony; and liable, on conviction, to be transported for life, or for a less period, or to be imprisoned, at the discretion of the court.

All classes of creditors whose debts are capable of being reduced to a present certainty, are put upon an equal footing in respect of the proof and of the dividend.

The foregoing outline, although of the most general nature, may, with reference to the acknowledged evils attendant upon commissions of bankrupt, suffice to shew that it is to abuses in the execution of the law that they are almost wholly attributable. This may be proved, not only by a due consideration of the laws themselves, which will demonstrate their excellence; but still more convincingly, by an accurate observation of their effects, when well executed. Where so executed, they answer their intended ends, even in the most complicated and difficult cases, more satisfactorily and completely, than could have been anticipated before actual experiment. Abuse in the administration of bankruptcy business is undeniably an existing evil of magnitude, but it seems also an evil susceptible of diminution to such an extent, as to become insignificant, when compared with the advantages of the system to which it attaches.

The manner of administering the bankrupt law is greatly modified by the mere locality in which a commission is executed.

In London commissions are in some respects worse executed than any where else, and the prevailing abuses, originating in circumstances supposed to be unavoidable, have been allowed to continue until they are considered as component parts of the system; whereas they are mere excrescences, and might be cut off without the slightest prejudice to the system itself. The standing lists of commissioners, in connexion with the rule by which the meeting for the bankrupt's last examination is directed to be held upon the forty-second day from the insertion in the Gazette, of the notice to surrender, and with the circumstance of all London commissions being held at the same place, are undoubtedly the source of much inconvenience and expense.

A practice prevails to a great extent, of unnecessarily appointing meetings, which would not otherwise have elapsed, to be held under many distinct commissions, (sometimes to the incredible number of fourteen, and even more,) by the same list of commissioners, not on the same day merely, but at the same hour. The inevitable effect is, to render it impossible to transact the business otherwise than in a tumultuous, and

inefficient manner, if at all. The abuse has been somewhat checked by a suggestion from the Lord Chancellor to the Commissioners, not to hold more than three meetings at the same hour. But this recommendation is not always attended to. The evil clearly originates in the constitution of lists of commissioners, which is no part of the statutory law, but an invention of a former Chancellor, (we believe Lord Harcourt,) engrafted upon it.

If the permanent lists of commissioners were set aside, the practice originally followed, and which still prevails in country commissions, might be revived; according to which, every person taking out a commission names the commissioners, subject to the approbation of the Lord Chancellor; and bankruptcy business would thus be thrown open to the legal profession at large, subject to the provision by which one, at least, of the acting commissioners, must be a barrister.

The arguments in favor of this change are, that there would always be a full set of commissioners for the administration of each commission, while there would remain no pretence for negligence or irregularity. This of itself would be a great point gained. Another advantage would be, that success in the practice of bankruptcy, as in other branches of the profession, would be the reward of talent, experience, and business-like habits. The most worthy in these respects, subject to the disturbing powers (if the expression may be allowed) of connexion and other incidental circumstances which can never fail to operate, will become the most distinguished and influential. The stimulus thus excited may reasonably be expected to produce a gradual improvement in the bankrupt law; and that diversity and incongruity in practice, which has sprung from the existence of numerous little jurisdictions of equal authority, acting independently of each other, would cease. The rules of practice would be derived from one source, and order and regularity would be the consequence. In many large provincial cities and towns, in which there are resident barristers accustomed to bankruptcy business, commissions are, generally speaking, so conducted as to be exempt from any serious

imputations, and, as far as possible, to effect the beneficial objects of the law. The fact is certain, and is rationally accounted for, by the consideration, that in provincial barristers of any repute, (and it is to such, that commissions, in their respective towns, are directed as quorum commissioners,) responsibility of character is united with competent knowledge; and the motives of ambition and desire of success which seldom fail to produce efficient habits of business, possess their natural influence, free from those obstructions to the due order of proceeding, and temptations to a wrong and negligent course of practice, which operate so unfavourably in London.

In the less frequented parts of the country, commissions are occasionally directed to attornies only, to whom bankruptcy business is not familiar, and who are consequently more liable to error, than the commissioners of whom we have spoken, and at the same time more exempt from that publicity and exposure to enlightened observation, which is a powerful check to professional misconduct. Under such circumstances, irregularities of a serious nature are, no doubt, sometimes committed. These instances, however, are far from numerous, compared with the total number of country commissions, very many of which are, in fact, executed in the nearest large town, by experienced commissioners, who also not unfrequently travel into the adjacent country for the same purpose. Nor would there be much difficulty in confirming and extending this custom, upon the same principle upon which all commissions against persons resident within forty miles of London, are required to be conducted there. Indeed it would generally prove a convenience, because, independently of the reason just assigned, the creditors of country traders consist chiefly of the wholesale dealers in large commercial towns, by whom they are furnished with their wares.

If, upon the whole, we come to the conclusion, that a system of bankrupt law is a desirable institution, and that the English system is in the main well calculated to attain the end proposed, the true line of policy to be adhered to respecting it, by the legislature, is, with a cautious but firm hand, to correct practical abuses, and to endeavour, by

remedying defects from time to time as they appear, ultimately to bring the system up to the highest degree of perfection of which it is susceptible.

### County Courts.

ALTHOUGH little was said during the last session of Parliament on the proposed establishment of County Courts, the subject is of too much importance to be passed over without observation here.

Imperfect as our criminal jurisprudence may be, there exists nevertheless some machinery by which offenders are to a certain extent brought to justice, and offences in some degree repressed: the inconveniencies of the Chancery system, in proportion as they fall upon persons possessed of property comparatively large, must affect a class comparatively small: but the great body of the people, who subsist upon the produce of their labour, or of small retail trades,—whose income, from whatever source, varies only from 25*l.* to perhaps 100*l.* a-year,—are absolutely without any tribunal to which they can resort for the redress of civil injury.

We say, without any tribunal; because, waving the pleasantry, that the courts are open, like the London taverns,—to all who can pay for entering,—it may be affirmed, as a melancholy truth, that it is the same thing to a man unable to pay for admission, whether there be no courts at all, or only courts, the price of entering into which is such as he can never pay.

Considering that the first object of government ought to be the protection of property and the diffusion of good moral habits,—considering the torments which most men experience at being obliged to put up with injustice, and the tendency which the absence of tribunals of justice has to encourage the most baneful and extensive immorality in the disregard and violation of contracts,—considering, too, that nearly seven-tenths of the people are exposed to all this misery, and stand, as it were, in the situation of outlaws, we shall hardly be deemed to exaggerate if we pronounce the reform of our criminal jurisprudence, and even of our Chancery system, as matters of

less importance than the institution of district tribunals which will open the doors of justice to all.

Without attempting, upon the present occasion, to investigate the merit or defects, or to enter into the history, of our common law courts, it will be sufficient to begin by establishing our first position, that their expensiveness renders them inaccessible to the great mass of the people.

It may, however, be worth while, incidentally to observe, that this expensiveness has grown out of a series of accidents, and probably was not in the contemplation of those who set the system on foot.

The first great cause of the expense, is the confinement of the principal tribunals to the metropolis. Consequent upon this is the second cause, the practice of requiring from the parties to a suit a technical written statement of the grounds of complaint and defence,—commonly called the pleadings; and, contributory to the proceeding, is the third cause, the exclusion of evidence, more especially the evidence of the parties.

Originally, to say nothing of the sheriff's tourn or county court, and the hundred court, there was a district jurisdiction in almost every village. The courts baron, holden in every manor once in three weeks, gave every man a cheap and ready access to justice. Unhappily, the judges of these courts, or those who appointed the judges—the lords of manors—being irresponsible and irremovable, and the administration of justice being a source of revenue, it is but too probable that the greatest abuses prevailed. The outcry which this naturally excited induced the sovereigns of those days to give their courts at Westminster a concurrent jurisdiction over matters which before were tried in the courts baron, with a power of removal to either party; and they were the more readily induced to take this step with a view to improve their own revenue, of which the sale of justice constituted a principal source. To have established and paid for district judges in sufficient numbers, would have been incompatible with their slender finances; they, therefore, sent the London judges to travel over the country; at first, (A. D. 1176, 22 Hen. II.) only once in seven years; afterwards, by Magna Charta, once a-year; and, at last, twice in a year, according to the present custom.

It being impossible, however, for so few judges to enter at large into every case that came before them, means were devised to divest each case before hearing of all extrinsic matter, and to present for investigation some single point or points in dispute. This reduction of the case, *ad materiam et ossa*, for the purpose of saving the judge's time, is effected by that series of written technical statements on both sides, called the pleadings, and is clearly rendered necessary by the incapacity of twelve judges to transact the judicial business of the whole kingdom. In the framing and copying these pleadings, very considerable expense is necessarily incurred, and it frequently happens that causes are decided quite independently of, and contrary to, their merits, upon some technical defect in these written statements.

At common law, too, the parties are rigidly excluded from making any oral statement of their case before the judge, and this renders necessary the expense of witnesses in numerous cases, where the defendant, if confronted, would not and could not have denied the plaintiff's claim.

Whatever may be the merits or defects of this system, its results in point of expense, are by no means equivocal.

We present, by way of example, an attorney's bill in two of the simplest cases that can occur,—that of an unwilling debtor, who has no defence, but against whom the creditor is obliged to employ compulsory process, which terminates without appeal;—and that of a disputed demand tried at the assizes\*.

#### Bill in Case on Arrest and Inquiry.

KING'S BENCH. Michaelmas Vacation, 1810.

#### Grubb against Howe.

|                                                      | Agent. |    | Attorney |    |
|------------------------------------------------------|--------|----|----------|----|
|                                                      | £.     | d. | £.       | d. |
| Letter to defendant for payment of debt without suit | 2      | 6  | 5        | 0  |
| Instructions and warrant to sue                      | 8      | 8  | 12       | 0  |
| Affidavit of debt                                    | 6      | 2  | 8        | 8  |
| Bill of Middlesex                                    | 10     | 0  | 14       | 0  |
| Warrant and messenger                                | 2      | 6  | 3        | 6  |
| Attending to instruct officer                        | 1      | 8  | 3        | 4  |
| Porters, &c.                                         | 1      | 6  | 3        | 0  |

\* The repeal of the law, stamp duty, will occasion some small deduction from a few of the items in these bills.

| <i>Hilary Term.</i>                                                                                              |       | Agent. | Attorney. |                                                                                        |  | Agent.   | Attorney. |

Total - - £27 13

It must be observed, that the above charges are upon the reduced and expurgated scale, such as the officer of the court allows against the defendant; besides these, however, the plaintiff has to pay his attorney other costs, which the courts do not call on the defendant to reimburse, to the extent of about one-third more.

It must also be observed, that a large proportion of actions commenced do not end so happily as the above; but that, by new trials, writs of error, arguments, and

motions on collateral matters, the expense is often increased tenfold.

Now, admitting that to the rich, who indulge in law as a luxury, the present system may be, as Lord Coke styles it, the perfection of reason,—to the poor, with whom justice is a matter of necessity, it is a strange sacrifice of the end to the means to compel an expenditure of from sixteen to sixty pounds to settle a dispute about six: but when, as in the majority of instances, the sixteen pounds can in no wise be extracted from the pocket of the suitor, to demand the payment of it as a condition precedent to the dispensation of justice, is neither more nor less than a denial of justice.

If perfect justice cannot be achieved at less expense, perhaps imperfect justice may be esteemed a less evil than an entire denial.

It remains, therefore, to be shown that a plan may be devised for distributing justice to every man, who stands in need of it,—justice, at least, of such a kind as shall not be worse than the evils of injustice.

Upon examining the foregoing accounts, it will be seen that one great source of expense is, the necessity under which a party residing in the country is placed, of employing two attornies; one in the country, and another styled the agent of the country attorney, in London. This is the unavoidable result of compelling the countryman to resort to the tribunals of the metropolis. A large proportion of the remaining items are referable to the pleadings, which the paucity of judges renders (amongst other reasons) an essential ingredient in the procedure of our higher tribunals.

There seems to be no way of avoiding these two sources of expense, other than that of distributing judges over the country in sufficient numbers to examine the parties and hear the whole of every contested case. By examining the parties, and allowing a rehearing where either of them is taken by surprise, the necessity of any detailed written technical statement would be in a great degree superseded,—the number of occasions on which it would be necessary to call witnesses would be much diminished,—and the expense of the attendance of witnesses might be reduced to the lowest amount, by limiting each juridical district to an extent in which every suitor might travel from his home to the court and back, on foot, in the course of a day.

Such an establishment might almost without perceptible alteration, be engrafted on our ancient institutions: the number of judges need not be formidable; and the expense would be absolutely insignificant compared with the advantages to be attained.

The plan might be effected with the smallest amount of change, by taking the old county court, or sheriff's tourn, as the basis.

According to the stat. 2 Ed. VI. c. 25, that court ought to be holden every month. Instead of confining it to the county town, why should it not be holden once a quarter in each of the three or four principal towns of the county?—This would, in turn, bring the court, to within ten or twelve miles of the door of every suitor:—The judge should be a barrister of competent knowledge and ability: the suits he should be appointed to adjudicate, might be limited to debts or injuries\*, to the extent of ten or twenty pounds, as might be judged most expedient: and those suits should be irremovable into the metropolitan tribunals. Upon summoning the defendant, he might be served with a printed form, containing a general indication of the nature of the demand against him; as, for money lent, or for goods sold, or for an injury done, about such a time: the trial should commence by examination of the parties, subject to penalties for the statement of falsehood: and the judge be empowered to appoint re-hearings till all the facts of the case were elicited.

The summons might be served, either by the plaintiff himself, or by an officer of the court; if by the latter, at the expense of 1s. or 1s. 6d.: printed forms of the various species of demand, with instructions how to fill up blanks, might be furnished for 6d.; judgment might be entered in a book, and a copy be given for 6d.; and a warrant for execution, with the charge for executing it, might be paid for by 2s. or 2s. 6d. more. The whole expense, which it might be expedient that the parties should incur, would thus be covered by 6 or 7 shillings.

\* In English law, "damages;" but we cautiously abstain from the use of the technical expressions of English law, which, being necessarily interpreted out of the books of the common lawyers, would, if adopted in these courts, unavoidably lead to the introduction of much of the complex and expensive practice of the courts of Westminster.

at the utmost: we say expedient, because the attention of the officer in expediting the suit, is more likely to be ensured by his receiving for his services, something from every suitor, than by a fixed allowance; and the small tax thus levied upon those who stand more immediately in need of the interposition of the court, would probably cover every expense of it, except the salary of the judge and the cost of the building.

With respect to the expense of judges, supposing fifty or sixty to be requisite for the whole of England and Wales, in order to allow one to every district, containing three or four large towns;—supposing these judges to have a salary of eight hundred a-year each,—and it would not be easy to find persons properly qualified at a lower rate of remuneration,—the whole expense might amount to fifty thousand a year. Surely that might be conceded towards distributing justice among a whole nation, which does not exceed the income granted to a single connexion of the royal family,—which does not equal the cost of a single frigate, or the annual expense of a single regiment. And yet, so straitened are we by prodigality on objects of comparatively little importance, that, it is but too probable, the expense of such an undertaking will be a main obstacle to its effective accomplishment. We are so much in the condition of the man who spends more than his income upon race-horses, hounds, and equipages, and then rates his wife for ordering necessary clothes for his children,—that while we pay thirty millions a year for army, navy, civil list, and colonies, we should never forgive the extravagance of a minister, who should propose to diminish the amount of public misery by laying out fifty thousand a year on the administration of public justice.

Be this as it may, it is plain from what has preceded, that nothing short of the appointment of numerous district judges, can effect a cheap administration of justice. To transfer, as was proposed last year, to three of the commissioners of the Insolvent Debtor's Court—already fully employed,—the whole mass of the business of the County Courts, might keep those gentlemen in a state of constant motion, but would load the distribution of justice in the inferior courts with all the impediments which have clung to it in the superior.

SESS. 1826.

But in the constitution of these courts, some other items are to be considered, which would not be altogether unattended with expense. A jury, if it be resorted to, would at least cost the time of those who composed it. In courts, like those we contemplate, such an appendage may seem unnecessary. As between the crown and subject, juries have sometimes interposed to shield a victim selected for oppression; but they are not always well qualified to draw a conclusion from difficult or conflicting evidence, and a judge has not often any motive for deciding corruptly between subject and subject. The attendance of jurors, now required at assizes and quarter sessions, operates as a considerable tax on the community, and it may be expedient to abstain from adding to its amount, by calling juries together upon every forty-shilling dispute. The most that could be necessary would be to allow either of the parties the privilege of a jury trial, on giving due notice of his intention.

Supposing a code to be substituted for our present oral law,—for greater safety, one stage of appeal might be allowed to a court constituted for the purpose in the metropolis, where of course the highest talent would be obtainable for such an institution, and where there would be the most enlightened public to watch its proceedings. Rehearings might be had to any number in the country upon disputed matters of fact; appeal to the metropolitan court, should, of course, be only permitted where either of the parties are dissatisfied with the decision of the judge below upon matter of law. In such case, all that could be necessary to obtain the decision of the court above, would be a written statement of the facts transmitted by the mail, free of postage, by the judge in the country, together with the reasons for his decision. Such an appeal could add little to the expense.

The chief alteration, which, in conjunction with the multiplication of judges would tend to diminish expense in these new courts, is the examination of the parties to the suit; nor is it easy to see how such a practice should be attended with any ill effects, although so much deprecated in our courts of common law.

It must be admitted, that there are many cases, in which, if the parties be excluded, no evidence whatever can be

afforded, touching the matter in dispute, and injustice must certainly prevail: also,

That there are many more—probably two-thirds of all that end in judgment—which would never proceed beyond a single hearing, were the parties in the first instance to be examined by the judge; there being rarely, in such cases, any material difference about matters of fact. It is obvious, that if such a course could be pursued, all the expense and delay, at present incurred, between the commencement of process and judgment, might be avoided.

The objections of English lawyers to the examination of the parties, seem to be chiefly,

1. A supposed irresistible temptation to perjury:

2. A supposed liability in the court to be deceived by such perjury.

Now, if the greater part of the inhabitants of a country act with an habitual disregard of truth, it will be scarcely possible for the business of life to be carried on. It is obvious, therefore, that the greater number of people do act with a regard to truth; in other words, that they do acquire and maintain a certain reputation for probity. But it is contrary to all probability, that a man who, by a long course of decent conduct, has acquired and maintains a reputation for probity, should, for the sake of enforcing or eluding a single demand, sacrifice, or incur the risk of sacrificing the reputation he has been at such pains to establish, as well as subject himself to the penalties attached to perjury.

Besides, the objection assumes that the desire of gain is the only passion which can impel a man to falsehood: but love, hatred, envy, revenge, and other passions, afford at least as powerful incentives to falsehood as the desire of gain; and if witnesses be excluded where they are obnoxious to this desire, so ought they to be excluded where their testimony is likely to be influenced by any other motive: in other words, upon this theory, *all* testimony ought to be excluded.

The inconsistencies of those who maintain this theory are, at least, as remarkable as the theory itself. The same man, who, on the ground of interest would rigidly exclude a plaintiff or defendant from giving their testimony in a civil court, does not object to the conviction, and perhaps the hanging of

a prisoner, on the testimony of the prosecutor, who frequently, as the result of his testimony, obtains a restitution of goods, which he alleges to have been taken from him:

The very man who would exclude the testimony of plaintiff or defendant, subject to the safeguard of cross-examination, in the Court of King's Bench, will acquiesce in the propriety of admitting the evidence of the same parties privately and by affidavit in the Court of Chancery, where the safeguard of cross-examination does not exist.

The truth is, that in proportion as a witness is under the influence of motives arising from any of the stronger passions, in that proportion is his testimony likely to be biassed or coloured, even without consciousness on his part; but it is not likely, generally speaking, that a man of average integrity will risk the penalty of perjury for the sake of a single advantage.

Is it then probable that a judge or jury will be imposed on by testimony so biassed, or even by perjury in an interested witness?

They who are conversant with the proceedings of English courts of justice must admit, that nothing is so speedily detected, and so fully commented upon, as any sinister interest likely to operate on the mind of a witness. Is he of kin to either of the parties—liable to the same charges—an inhabitant of the same district—has he had any misunderstanding with either of them?—All this the mode of examination fully discloses—all this is the subject of repeated animadversion.

When the bias to which a witness is exposed has been pointed out and observed on, it is not easy to conceive how a hearer, of whatever capacity, should fail to make the requisite allowance for such bias.

In point of fact, much more than the due allowance is commonly made; and testimony is often received with distrust when the character and demeanour of a witness ought to exempt him from all suspicion of yielding to interested motives.

It is scarcely necessary to pursue this branch of the subject further. Without referring to the practice in *foro domestico*, where, if a master of a family wished to settle a dispute between his servants or children, he would deem it an absurdity

to exclude from a hearing the parties involved in the dispute;—without referring to the affidavit evidence of the Court of Chancery, or the admission of the testimony of the prosecutor in a criminal court;—we may conclude that the foregoing observations rest upon no untried theory, since the courts of common law themselves, in referring complicated cases to an arbitrator, under an order of *nisi prius*, uniformly empower the arbitrator to examine the parties on oath. But we have dwelt somewhat at length on this branch of the proposed institution, from the persuasion that no effective advance can be made towards cheap and expeditious procedure, without the public examination of the parties in the presence of the judge.

The measure has been delayed for a season, with a view to a return which has been called for by Mr. Peel, of the number, nature, and extent of various local jurisdictions already in existence. These are of two kinds; inferior courts which, excluding the parties, proceed according to the rules of the common law, and in which actions may be commenced to any amount, subject to removal by either of the parties into the Courts at Westminster,—and Courts of Conscience, in which the parties are examined, and the causes are irremovable.

There are few of our great towns and ancient cities without a court of both kinds; and some apprehension has been entertained as to the difficulties which may be occasioned by the conflicting interests of those who are connected with such tribunals.

The difficulty, however, is not of a very formidable nature. As to the courts of conscience, very little alteration is requisite to place them on the same useful footing as the proposed county courts. At present they are conducted by unsalaried and irresponsible commissioners, generally tradesmen in the neighbourhood, and not always the most competent to form a judgment on disputed questions of fact or law. Many of them sit with closed doors; and few have jurisdiction beyond 40s.

The only alteration requisite, is to substitute a salaried and responsible judge, of adequate legal attainments, for irresponsible commissioners.—to extend the jurisdiction to 10l. or 20l.—and to insist on uniform publicity.

With respect to the inferior common law courts, such as the Lord Mayor's court in London, the Palace court, the Tolsey court at Bristol, the courts at Exeter, Norwich, and many other places, they should likewise (if not at present) be furnished with adequate judges; parties resident within the jurisdiction should be compelled to resort to such courts for all claims under 10l. or 20l.; such causes should be irremovable to the courts at Westminster; and above all, in causes to such amount at least, the parties should be admitted to make their own statement, and common law pleadings be abolished.

There are parts of the procedure of some of those courts which might, with advantage, be introduced into all the local jurisdictions which it is now proposed to establish. For instance, the practice of *foreign attachment*, as it is called, by which a creditor is enabled to obtain toward the satisfaction of his demand, a debt due to his debtor.

If the establishment of the proposed new courts is likely materially to affect the interests of officers in the courts at Westminster, especially of officers who, under existing laws or existing usages have paid for their places, it seems but just that they should receive compensation to the extent of injury established. With regard to the altered prospects of young attornies, we can hardly feel as a veteran of that class, who some years since printed a very insolent letter on this subject to Lord Redesdale, in which he seemed to think mankind as much the natural prey of attornies, as sheep of mankind, and asked his lordship, with the utmost *naïveté*, whether he had calculated to what extent the number of writs would be lessened by the county courts bill, and how young attornies were to live if the measure passed; considering the well-being of three or four thousand attornies as a matter of infinitely more importance than the distribution of justice to sixteen millions of people. If the alteration cannot be effected without lessening the incomes of the young attornies, that, as well as every other infliction of pain, must be a matter of regret to every man of reflection; but it is impossible for any one who has cast his views beyond his own narrow circle, to consider the afflictions of three or four thousand as a counterpoise to the

afflictions of four times as many millions.

We trust that no such feeling will prevent Mr. Peel from persevering in an undertaking which will establish his claim to the gratitude of his country to a greater extent than any other measure he has ever taken in hand.

With respect to Lord Althorp, the original proposer of the plan, it is only justice to repeat, in the words we used last year\*, that "with the most praiseworthy industry and benevolence, he has for many years been labouring to establish for the people at large, courts, which should combine all the advantages of courts of conscience without their defects; which should proceed in the same natural and summary way, but be presided over by judges competent to the discharge of their duties." Bating his proposal to place the appointment of the judges in the hands of the Lord Lieutenants—a patronage which seemed open to the worst abuse—the whole of his plan appeared deserving of high commendation, and the public will have cause to rejoice if any thing like it be now carried into effect.

#### *Addressing of Juries by Felons' Counsel.*

ACCORDING to the present practice in our courts of justice, parties in *civil causes* are allowed to employ counsel to address the jury for them, as well as to conduct every other branch of the cause;—so are parties in a prosecution for *treason*—the highest, and in *misdemeanors*, the lowest class of offences cognizable by our criminal procedure. But in prosecutions for ordinary *felonies*, which constitute a large majority of the offences tried, the prisoner, although allowed to employ counsel for the purpose of examining and cross-examining witnesses, and for the purpose of suggesting and arguing points of law relevant to the defence, is not allowed to address the jury by counsel, but must, if he has any observation or statement to make, make it himself.

Many persons have been struck with this anomaly in our criminal procedure; and some esteeming it a hardship on the prisoner charged with a felony, it has

twice been proposed in Parliament to allow him, as well as other parties, to address the jury by counsel.

In order to ascertain whether such a proposal ought to be carried into effect, the first thing to be determined is—What is the best mode of procedure in courts of justice, for attaining the discovery of truth?—and then, Is the procedure in cases of felony, conformable to such mode; or does it vary therefrom in any and what respect?

The basis of all good procedure—that is, of procedure by which it is proposed to ascertain the truth in judicial inquiries with the least amount of delay and expense—is the public examination and cross-examination of the parties and witnesses.

The importance of publicity, as a sanction for truth in the case of every witness, whether a party to the cause or not, will scarcely be denied. A witness who might not hesitate to risk a lie in private, or on affidavit, will rarely venture to submit himself to the contempt of a crowded court by a mis-statement, which it is always highly probable that the cross-examination will immediately expose. Besides which, the suddenness of the question, and the distraction occasioned by the crowd and the whole apparatus of the court, leave him little time for deliberation, and seldom fail to elicit an answer according to fact.

The examination of the parties, though practised by the Court of Chancery—though the only mode, in many instances, of obtaining any evidence at all on the point in dispute,—and though it would probably, at the first interview, terminate seven causes out of ten—is altogether rejected in our courts of common law.

The expediency of such an examination having been entered into at large in the preceding essay, we proceed at once,—keeping in view the state of existing institutions,—to the inquiry how far the employment of advocates is likely to contribute to arriving at a correct judgment, either in matters of fact or matters of law.

The advantages of advocacy in this respect, seem to be,

1. The examination of witnesses is facts which want of the requisite instruction, or indolence, might prevent the judge from ascertaining; and which examination the party to the cause, from want of practice in judicial matters, may

\* *Parl. Review*, Sess. 1826, p. 750.

be unable to conduct effectually: also, the presentation of those facts to the mind of the judge in their most effective light:

2. The suggestion of points of law which, but for the advocate's exertions, might escape the notice of the court.

The disadvantage of advocacy, with a view to the above end, seems to be,

The dexterity with which the practised advocate frames a partial or false statement of his client's case, and the possibility of his imposing on the court thereby. A party possessed of ordinary integrity, may be anxious to state the truth, and the whole truth; a party of less than ordinary integrity may be unable to sustain throughout a false statement; but the advocate can rarely have the desire to state the whole truth, and always has the greatest ability to disguise falsehood. His object must always be to gain his cause; with this view, the *truth* must generally be with him a matter of indifference, and whenever adverse to his end, a matter to be repressed.

The disadvantage here pointed out, seems, in the present organization of our tribunals, to exist more especially in speeches made by the advocate on matters of fact, as will appear from the following reasons.

When the points of law have been suggested and argued; when all the relevant matters of fact have been indicated or extracted, by skilful examination of the witnesses; when the parties themselves have made their respective statements; all that is requisite for arriving at a correct judgment has in general been done. Harangues upon matters of fact, except in a small number of very complicated cases, can seldom consist, and seldom do consist, of any thing other than appeals to the passions, encumbered and lengthened by references to circumstances unconnected with the point for decision, and introduced for the express purpose of distracting the attention and prejudicing the judgment.

That this is not an unfair representation of the object and effect of an advocate's address to the jury, in a very large proportion (in forty-nine out of fifty) of all causes tried, let those who have been in the habits of frequenting courts of justice determine.

On the other hand, it must also be admitted that a cause occasionally occurs, so complicated or unusual in its circum-

stances, as to require all the skill of a practised advocate to place them in their true light either with a judge or jury. But even here, the opposing advocate has all the advantage arising from complication and difficulty, for placing the same circumstances in a false point of view.

If this be a correct statement, the question seems reduced to this—whether, for the purpose of diminishing the chances of misdecision in a very small proportion of all the causes tried (supposing that purpose can be attained by the employment of advocates), it is expedient that the public should incur, in by far the larger proportion of causes, the expense and delay, and perhaps some additional chances of perplexity and misdecision, occasioned by the employment of advocates.

If, under the sanction of complete publicity, and with a well-organized judicial establishment, the people could be secured against ignorance or indolence in judges; if the parties in such case were always confronted, and compelled to make their own statement, it may seem questionable whether advocates might not, with advantage, be dispensed with.

Unhappily, the requisite degree of publicity, for securing due exertion on the part of the judge, unassisted by advocates, is scarcely ever attainable.

With the best and most intelligible code that could be devised, it is but too probable that the people at large would not feel a sufficient interest in the proceedings of civil courts of justice to attend them frequently; though such proceedings, considering their number and extent, and the manner in which they are mixed up with the whole business of life, are of infinitely greater importance than any other judicial investigations. But in the present state of our jurisprudence, the civil courts, though in some degree actually open, are virtually closed to the public; for it is much the same thing whether a man be excluded from seeing and hearing what goes on, or whether he sees and hears, but is utterly unable to comprehend;—and it will scarcely be denied that the language and forms of our civil procedure are as unintelligible as a foreign language, to all but those who have made them their peculiar study.

Besides this, the judges are so few, the causes to be tried so numerous, and our jurisprudence so complicated, that, without the aid of an advocate, it is possible

the judge might not have time to hunt out the law in every civil case that comes before him. Advocates, therefore, must continue a necessary appendage, at least to our civil courts.

Having thus far inquired to what extent the employment of advocates is likely to be auxiliary to the discovery of truth, and the arriving at right decisions; and having intimated the mode of procedure in other respects most conducive to such objects; it remains to examine the objections against the practice at present pursued in the trial of cases of felony.

And what is that practice? In the first place, we have, in such cases, that main element of good procedure in which our civil tribunals are so signally defective—the appearance of the parties before the judge. The prosecutor makes his own statement (sometimes preceded, sometimes not, by the statement of an advocate), subject to the most effectual cross-examination; and, although the prisoner is not interrogated on the subject of the charge, he is enabled to make any statement, or put any question, with a view to his defence.

In order to the discovery of truth, it would undoubtedly be desirable that the prisoner should be calmly interrogated on the subject of the charge, as well as the prosecutor. But the state of our penal enactments has the effect of enlisting the sympathies of all present in favour of the guilty; and the great object of a trial seems to be, not so much the discovery of truth, and the conviction of an offender, as that a kind of a race should be run between the prosecutor on the one hand, and the accused, aided by all the subtleties of law, and the defects of procedure, on the other: the chief anxiety on the part of the spectator is, that the accused should not lose any one of the advantages thus afforded: they give him a fair start on the 'vantage ground of chicane; just as sportsmen, to add greater zest to the pursuit, allow the hare a certain distance before they let slip the greyhound.

Upon no other ground is it possible to account for the almost universal and rooted prejudice in favour of the established rule, which prohibits the examination of the prisoner.

That the rule is of no advantage to the innocent, is most manifest. For *his* sake it could never have been established. It is the interest as well as the desire of

every honest man who lies under suspicion, to dispel the cloud which hangs over his motives and his conduct; to afford every explanation which may tend to place them in their true light; and to provoke questions for the sake of affording answers, every one of which may form a new link in the chain of evidence which is to establish his innocence.

On the other hand, if all the criminals in the world had conspired together to frame a system of procedure, the best adapted to cover their misdeeds, could they have devised a rule more effectual for their purpose than the rule in question? Innocence insists on being heard: guilt alone claims the privilege of silence.

If it be said that interrogation would be vexatious to the prisoner, so also is any species of trial, and still more any species of punishment. Whatever weight this objection may have, it is equally an argument against all penal infliction, against all judicial investigation.

But the prisoner's answers, it may be alleged, to questions directly addressed to him, may lead to his conviction. If this be a reason for abstaining from them, it would be equally a reason for excluding every kind of testimony; the only object of that testimony, on the part of the prosecution, being, to lead to conviction.

The case, indeed, might be different, if any thing like a tendency to self-inculpation had ever been observed on the part of the innocent; but as no trace of such disposition exists, it is idle to take precautions against it.

Again, if the rule be established, with a view to spare the prisoner the chagrin of conducing to his own conviction, the object is not consistently pursued; for letters written by him, as well as expressions dropped in conversation, are freely received in evidence. So that the court often proceeds on hearsay,—on the slippery recollection of uncertain expressions,—when direct testimony might be obtained from the party who is alleged to have used them.

The rule too is in opposition with the statute law, (2 and 3 Phil. and Mar. c. x.) which enjoins justices of peace to take the examination of persons suspected of felony, and put the same into writing: this examination so taken is constantly received in evidence upon the subsequent trial. But with the common law rule on

one hand, and the statute on the other, a magistrate can favour or press a prisoner, as may best suit his inclination.

In domestic life, no man would hesitate to examine his servant or child, touching any suspicion he entertained against them; he would esteem the prohibition of such an examination as no small impediment in the way of truth. Why should a different course be pursued in public?

That the power of interrogation might be occasionally subject to abuse, and conducted with unjustifiable harshness, is a reason for providing safeguards against the abuse; but not for rejecting interrogation. If possibility of abuse were a reason for rejection, no institution could ever be established; for there is none which may not be exposed to this possibility. Under sufferance of feeble judges, advocates often abuse the faculty of cross-examination, by browbeating and perplexing an honest witness; but no one would contend that the practice of cross-examination ought therefore to be relinquished.

However, a practice of interrogating the prisoner could be open to little abuse: in the first place, it would only be necessary to interrogate him where the chain of evidence was defective; and in the next, the extreme publicity of the proceedings, and the sympathy in favour of criminals, would preclude the probability of any improper harshness.

This publicity, which we have shown to be one of the essential ingredients of good procedure, is more fully obtained in our criminal courts than in any other. The attendance is always numerous, the interest taken in the proceedings intense, and the proceedings are, in substance at least, intelligible to the meanest capacity. The infliction of pain, in the shape of punishment, being the general result of them, they are entered on and pursued with a degree of solemnity bordering on awe; the judge appearing to partake of the general impression, proceeds with more than usual caution; makes himself fully master of the case before him; and, if it be attended with any difficulty, sums up minutely to the jury. All eyes fixed on him, it is scarcely possible that indolence should gain the ascendancy over his sense of duty, and lead him to omit any point material to the prisoner's defence.

The possibility of this is, however, precluded by the prisoner's being allowed to employ counsel for the examination of witnesses; and the same privilege with respect to the suggestion of points of law, affords an equal safeguard against the effects of possible ignorance on the part of the judge.

The means resorted to for attaining truth and right decision, in cases of felony, being thus far so much superior to those which obtain in civil causes, what have been the arguments adduced in favour of allowing the prisoner's counsel, in addition to all this, to make an address to the jury?

If the main object of procedure in courts of justice be the discovery of truth, in order to secure the conviction of the guilty and the acquittal of the innocent, it is incumbent on those who support the affirmative of this question, to shew that a speech by the prisoner's counsel to the jury, in addition to the course already pursued in cases of felony, would materially contribute to this end; or, what is the same thing, that, without such a speech, it is probable the end will not be fully attained.

The arguments, however, employed by Mr. George Lamb, the mover\*, are, 1st. The inconsistency of allowing counsel to address the jury on the part of the prisoner in cases of treason and misdemeanor, and refusing the same privilege in cases of felony. 2nd. The authority of certain learned persons who, in former times, have asserted that prisoners have a right to benefit of counsel. 3rd. An exposure of the vulgar fallacy that the judge is counsel for the prisoner. 4th. An allegation that in some instances innocent persons have been convicted.

Now, with regard to the alleged inconsistency, although uniformity is sometimes agreeable in a building, and always convenient in a system, it does not constitute a principle upon which any grave legislator could act, to the exclusion of the manifest dictates of utility. It is only by their conformity with or departure from utility, that the merits of

\* *Ante*, p. 539. We regret to state here, that this is one of the few speeches of this session which bears internal marks of having been exceedingly ill reported. We have collated all the principal reports, but have not been able to succeed in giving a satisfactory version of it.

defects of institutions can be estimated; and uniformity is a mere accident, for which no reflecting person would sacrifice a greater advantage.

The laws of Draco were patterns of uniformity: but the clumsy and inefficacious contrivance of visiting uniformly all offences with death, may be deemed too expensive a price for the virtue of uniformity.

However, the inconsistency complained of is by no means so marked as is commonly represented. In the civil courts, parties appear by attorney, and are rigidly precluded from making any statement in their own cause. Unless, therefore, counsel were permitted to speak, no statement of the case could be made. But the practice upon such occasions ought to furnish no rule for causes altogether differently circumstanced,—causes in which both parties appear before the judge, and make their own statement.

The law and practice with respect to treason stands on a footing peculiar to itself. If governments were what they ought to be, either no such laws would be necessary, or, at all events, the punishments under them might be exceedingly light. Where governments consult the interests of the people less than they ought to do, such laws must necessarily be severe, in order to insure acquiescence in abuses. But the result of this state of things is, that the sympathies of a large portion,—often of a majority of the people,—are enlisted on the side of parties tried for treason: they are seldom viewed with any moral dislike; and, with the exception of the rulers, even the party who disapprove of the proceedings would be glad to dismiss them with a punishment lighter than death.

The universal voice of the people, therefore, has required that every facility should be afforded for defeating the operation of those laws; and counsel have been called for to address the jury on the part of the prisoner; rather with the design of enlisting their passions in his favour, and of multiplying the chances of escape, than with any intention to promote the discovery of truth.

With respect to misdemeanors, there certainly is no reason why they should not stand on the same footing as felonies; but with a view to mere uniformity, there is at least as much ground for asserting that

the practice in trials for misdemeanor ought to be assimilated to that in trials for felony as for asserting the converse of the proposition. When it has been shewn which of the two practices is the more conducive to the discovery of truth, it will be easy to say which ought to conform to the other.

The argument of authority, especially in the shape of *the wisdom of our ancestors*, can scarcely have much weight except with those who are incompetent to form any judgment on the subject in debate, or who surrender the use of their own understandings. Indeed, Mr. Lamb himself, in one part of his speech, treated the argument somewhat lightly. "The time," he said, "was gone by when they were in the habit of looking upon the wisdom of their ancestors as something infallible; he thought, as the great Lord Bacon once said, in his advice to a young judge, that they should use the wisdom of other times as a light to open their eyes, but not as a guide to lead them by the nose."

But authority, in order to have the slightest weight, ought at least to be authority to the point. Now, the authorities adduced only go to shew that prisoners ought to have counsel, not that such counsel ought to be allowed to address the jury. Whether the interests of justice would be best attained by confining the counsel to the examination of witnesses, and to addressing the judge, seems never to have occurred to the illustrious persons referred to, or to the hon. gent. himself.

For those purposes, prisoners have long been allowed to employ counsel; and there is therefore an obvious fallacy or mis-statement in the very terms of Mr. Lamb's motion ("for leave to bring in a bill to allow persons prosecuted for felony to *make their defence by counsel*"), from which the ignorant are led to infer that such persons are now precluded from all assistance of the kind.

Undoubtedly the judge is not, as he is sometimes said to be, counsel for the prisoner: he cannot suggest topics of defence; he cannot be instructed on the points as to which it may be most expedient, on the part of the prisoner, to examine the prosecutor's witnesses: but this vulgar error has ceased to obtain credit, and was not advanced by any one of those who opposed the motion.

The allegation, that some innocent persons have been convicted under the present mode of procedure, does not advance the argument, unless it be shewn that these convictions were occasioned by the want of a speech to the jury: but that such speeches are no guarantee against erroneous verdicts, is proved by the experience of our civil courts, and the numerous instances in which new trials are applied for and obtained.

Verdicts of this nature, (to a certain degree the unavoidable result of human fallibility,) have occurred at least as frequently in cases of misdemeanor in which speeches are allowed, as in cases of felony, in which they are not. At this moment there is, before the Secretary of State, a case of supposed erroneous verdict in misdemeanor: that of *Tuft*, who, at the Middlesex Michaelmas Sessions, 1826, was, notwithstanding a powerful address by counsel, convicted on testimony alleged to be perjurious, of having thrown a female into the water at Cowley Bridge.

Mr. Horace Twiss, in a speech replete with eloquence\*, which (according to the report in the *Morning Chronicle*) was much cheered, combated at considerable length the phantom of the judge's being counsel for the prisoner;—(phantom we call it, because, as we have stated, the argument was not urged by those who took the opposite side in debate, nor have we ever heard it advanced by any person capable of reasoning;)—and animadverted severely on the inconsistency of allowing a speech for the prisoner in cases of treason and misdemeanor, and refusing it in felony. Upon this we have observed sufficiently in the preceding pages; his main argument, however, stripping it of the accumulated rhetoric, was as follows:—

‘Any statement on the merits must be made by the prisoner; but the prisoner might be disabled by illness, blindness, deafness, or some other visitation. If there were such a disability in a majority of cases, the legislature would, no doubt, relax the law; but, in the majority of cases, this ground for relaxation did already exist; for the prisoner was placed in a situation, the terrors whereof were such as would take away from any average man the common resources of the human mind.’

\* *Ibid*, p. 544.

Now, our only objection to this is, denial of the premiss. We deny that average men, or that men with less than the average amount of intellect, are thus deprived of their resources—or, to use a homely expression, *dumbfounded*—on being arraigned in a court of justice; the instances are indeed rare in which a prisoner, who has any thing to say for himself, is prevented from speaking by alarm or confusion; while the consciousness of innocence not unfrequently produces an unexpected degree of eloquence. Where the vanity of a man is concerned,—where he wishes to make a display, and dreads the fastidiousness of his audience,—the sight of a numerous assembly will, (and that, too, in proportion to his merit,) often affect his powers of utterance; but where all that is required is a plain statement, and the party has no solicitude about the manner of making it, words are rarely wanting: in general, the less educated feel the least difficulty in making such a statement, because the manner in which it shall be made never occurs to them as a matter of solicitude. Women and children are, for the most part, the best witnesses, and undergo cross-examination with less embarrassment than any others.

Mr. Denman, however, states, that upon one occasion he actually tried two deaf and dumb persons; and thence argues the necessity of allowing a speech to be made for all prisoners\*.

Without adverting to the circumstance that the trial of a deaf and dumb person can hardly be expected to take place once in a century, and that it would be somewhat singular to form a general legislative rule on so rare an exception, we cannot avoid remarking that these deaf and dumb persons had probably full means of making themselves understood; if they were capable of conversing by signs, as most deaf and dumb persons are, a sworn interpreter, whose services they would be entitled to command, might communicate a statement of facts as easily, and more credibly, than an advocate.

Mr. Scarlett, who spoke more to the point than any other person, agreed†, that if addresses to the jury by counsel on both sides were found to be the best mode of attaining truth in civil causes, no reason could be assigned why a different

\* *Ibid*, p. 548. † *Ibid*, p. 546.

course should be adopted towards criminals.

He objected, as did Mr. Twiss, to the manifest partiality of allowing counsel to speak for the prosecution, and not for the defence; but he further assigned, as a reason for such objection,—and the observation evinces much knowledge of human nature, and is entitled to much weight,—that “it was a natural disposition of the mind, that it should receive “with a readiness to believe, the well-“connected chain of facts so brought “before it, and afterwards feel a disposition “to explain the facts offered in defence, “so as to show the consistency of the “first statement,”—though upon the whole, Mr. Scarlett thought the present practice far from operating as a hardship upon the prisoner: and that, on the contrary, the allowing him to address the jury by counsel would more frequently lead to conviction, as the consequence of the prosecutor's or judge's reply.

If it be true that addresses to the jury by counsel on both sides are found to be the best mode of attaining truth in civil courts, it seems to follow, irresistibly, that the same mode would be the best in criminal courts. But there are many who doubt the premises.

In the present state of our judicial institutions, the expediency of employing advocates to examine witnesses, and to address the judge on points of law, has been admitted in the outset of these observations; but it has also been suggested, that addresses to the jury seldom consist of any thing other than a mischievous appeal to the passions, or attempts to perplex—consuming time to no good purpose, and generally tending to divert attention from the real point for decision.

In the objection, however, to a speech on one side only, we entirely coincide.

It is true, the general usage of the profession requires that the speech of the prosecutor's counsel should be confined to a bare statement of facts. Independently, however, of “the natural disposition of the mind to receive with a “readiness to believe, the well-connected “chain of facts so brought before it, and “afterwards to feel a disposition to “explain the facts offered in defence, so “as to show the consistency of the first “statement;” it must be admitted, that in the class of advocates, as in almost

every other class, there are persons destitute of principle and character, who will descend to any baseness to gratify the passions of a client, and to obtain the support of the lower class of attorneys. Such persons do *not* confine themselves to a bare statement of facts, but employ every artifice to give the prisoner's case the worst possible complexion. There is, therefore, always an apparent, and sometimes a real disparity in allowing a speech on one side only.

As the result of the foregoing investigation, it appears that one mode of obviating this disparity, and of removing much ground for complaint, might be to suppress addresses to the jury by counsel for the prosecution in cases of felony and misdemeanor. In ninety-nine cases out of a hundred, such addresses are useless;—the indictment which is read to the jury informs them, that on such a day the prisoner stole such and such goods at such a place, the property of such a person; and this is all the preliminary statement, if any, necessary to enable them to understand the testimony as it proceeds.

That such speeches may be dispensed with is no theoretical dream. It has always been the custom to suppress them in cases of felony, when there has been a pressure of business; and upon a recent circuit, Mr. Justice Littleton suppressed them in such cases altogether. We never heard of any complaint, or of any suspicion that the administration of justice had suffered in consequence.

Undoubtedly there are sometimes, though rarely, cases of involved or circumstantial evidence, in which a preliminary statement may conduce to the understanding of the testimony. If, in such cases, speeches are allowed on the part of the prosecution, they ought also to be allowed on the part of the defence. But before any such alteration be made in the practice, it ought to be maturely considered whether the advantage of obtaining a preliminary statement for cases so few in number, will not be outweighed by the perplexity, delay, and expense, which will be occasioned, as it may be apprehended, by allowing three speeches to the jury in the greater proportion of all cases tried; and whether it would not be preferable to prohibit speeches to the jury on either side.

That the great body of prisoners would

in reality gain nothing by allowing a speech to their counsel, will be conceded at once by all who are conversant with the proceedings of our courts of justice. The changing the address of the prosecutor's counsel from a bare statement to an artful comment on the facts, which change must ensue almost unavoidably upon permitting the prisoner's counsel to address the jury; the power of reply which must also ensue, and the necessity imposed on the judge, of exposing the fallacies which, in the greater number of instances, would form the only materials of a speech for the prisoner, must deprive him of many of the chances of escape which he now enjoys, and would infallibly diminish the number of improper acquittals. This undoubtedly would be among the beneficial effects of such a measure, and ought to be weighed in the balance against any apprehended ill effects;—but with the exception of Mr. Scarlett, this is the very reverse of what was expected or designed by those who supported the measure; the grievance complained of, and the grievance proposed to be remedied, being the alleged hardship of refusing to the prisoner the advantage of a speech by his counsel.

Indeed, the matter under consideration, is of greater difficulty than seems to be apprehended by those who take exceptions to the present rule of practice, involving ultimately, a question of no less extent than the expediency or inexpediency of hearing advocates at all, or at any rate, upon matters of fact: but the following recapitulation of the preceding observations may perhaps assist the reader in coming to a right conclusion on the matter in debate.

1st, The question for consideration ought to be, what are the best means for discovering truth in a judicial inquiry,—and not, what is a hardship or otherwise on the prisoner? for if we are to consider the hardship on him, rather than the hardship on society, we shall abstain from trying, and still more from hanging him; both of which proceedings he will undoubtedly esteem a hardship\*.

\* Were we to digress into so irrelevant a topic, it might further be contended, that in the present state of things the present practice does not operate as a hardship on the prisoner, the forbearance of judge, jury, and prosecutor, occasioned by the silence as to matters of fact imposed on the prisoner's counsel, being, upon

2d, An indispensable element in the means best adapted for discovering truth in a judicial inquiry, is the appearance and examination of the parties before the judge in public, and the statement of his own case, by each of them.

3d, Whether, in addition to this, and to the hearing of the evidence on both sides, a statement of the case and comments upon it by advocates, will facilitate, impede, or in nowise affect the discovery of truth, is a question which seems at present involved in doubt. Supposing, as according to the present practice, the examination of witnesses, and the arguing of points of law to have been conducted by advocates,—

Among the reasons *in favour of* such a statement and comment seem to be,

That great as may be the disparity between advocates, the disparity between parties is still greater:

That by the contentious investigation of opposite advocates, facts may be placed in a light in which they would not otherwise have been viewed by judge or jury:

That attention may be drawn to minute, but important links in a chain of evidence, which might otherwise have escaped notice; and that inferences may be deduced from the whole by argument, which, unassisted by such argument, the court would never have drawn.

Among the reasons *against* such a statement and comment seem to be,

That truth is never the object of the advocate, but the success of his client, whether right or wrong:

That in his *professional* morality, he is thoroughly indifferent to truth:

That it is generally his business, and his interest, to resort more or less to falsehood or misrepresentation for the purposes of his client:

That from practice he is enabled to resort to sophistry and misrepresentation with a much greater chance of success than other men:

That, admitting the opposite advocates to be able reciprocally each to expose the sophistry and misrepresentation of the

the whole, productive of more acquittals than ever could be obtained by the united powers of eloquence and logic, supposing them to be possessed by the class of junior counsel, to whom alone it can be worth while to practise in the criminal courts.

other, it may still happen to the tribunals, as at present constituted, to be left in a state of entire perplexity and confusion :

That, if attention be sometimes awakened by advocates to some points which might otherwise have escaped it, inattention and forgetfulness are more frequently produced by their prolixity, impertinence, and personal altercations, by which also much time is unnecessarily consumed.

4th. The course of practice in civil courts affords no analogy or assistance towards solving the present question ; those courts being deprived of that primary element in the means of discovering truth, which prevails to a certain extent in the criminal courts,—the appearance of the parties to make their own statement, and be publicly examined in the presence of the judge. In the civil courts no statement could be made at all ; and the declaration being a tissue of fictions, no information could be conveyed to the jury, unless counsel were allowed to address them. Counsel speak in those courts, therefore, from the necessity occasioned by the rule which excludes the parties, and not because their speeches afford the best means of discovering truth.

So in treason, the unanimous clamour of the people has obtained counsel for traitors,—not with a view to the discovery of truth, but to the escape of the traitor from a law which every body but those interested in misgovernment believes to be disproportionately severe. If the government be bad, the great body of the people must sympathize with the traitors who rise against it ; if it be good, the great body of the people will side with the government, and a very slight punishment will be sufficient for any attempt to disturb the public order.

With regard to misdemeanor, the practice on trials for such offences is at least as much open to consideration and revision as the practice on trials for felony. But,

5th. Whatever course be deemed the most expedient for the discovery of truth, whether the rejection or the admission of speeches by advocates, it is manifest beyond dispute, that for all purposes whatever,—for attaining truth,—for conciliating public opinion,—for procuring

respect to our judicial institutions,—it is absolutely necessary that both parties should, in all cases, be placed on the same footing. If the prosecutor's counsel address the jury, so ought the prisoner's ; if the prisoner's be silenced, so ought the prosecutor's. At present a disparity exists ; and whether that disparity be productive of improper acquittals by the compassion it provokes in the tribunals, or whether it be productive of improper convictions by the practised skill employed on the part of prosecutors, it ought, without delay, to be abolished.

#### CONSTITUTION.

##### *Representation of Edinburgh—Reform in Parliament—Bribery Bill, &c.*

THE principle on which the theory of representation rests, is, that if the governing body be not responsible to the people at large, the interests of the people at large will, in the long run, be sacrificed to the interests of the individuals composing the governing body.

Under a representative system, however, it is manifest that the powers of government ultimately reside in the electors ; and if those electors be few in number, with relation to the rest of the community, it is equally clear that they will individually have as decided an interest in the profits to be derived from misgovernment, as a governing body independent of electors. The next problem, therefore, is, how to prevent the electors from consulting their sinister interests, to the detriment of the rest of the community—(a matter of difficult accomplishment, if, according to the above assumption, the powers of government are really vested in them) ;—or how to reduce those sinister interests to so small an amount as to leave the electors a greater profit in the general benefits to be derived from good government.

It is plain that, in proportion as the electors are many, their interest in misusing the residue, who are not electors, approaches an immaterial quantity.

The profits which 200 or 2000 electors might extract from the misgovernment of 20,000,000 non-electors, is incalculable. But if ten millions out of the twenty millions were electors, each of the electors could only obtain the profits to be derived

from the misgovernment of a single individual,—an interest which might be too small to produce any assignable ill effect.

Without entering, therefore, on the contested ground of universal suffrage, we will assume, for the purposes of the present argument, that the interests of the community would be sufficiently secured by vesting the right of suffrage in some large proportion (say a half, or a fourth) of the whole number.

A distinction, however, must here be made between an illusory and a real right of suffrage. If the right be conferred on A, B, C, and D, but A is enabled, by bribery or intimidation, to induce B, C, and D to vote as he directs; A has four votes, B, C, and D have none; A makes a choice, B, C, and D make none; A's right is real, and he is an elector; the right of B, C, and D is illusory, and in effect they are not electors.

And this influence of will over will is plainly distinguishable from the influence of understanding over understanding.

If a man of strong and cultivated understanding, persuade a man of inferior intellect to vote in a given way, the man of inferior intellect exercises a discretion, and makes a choice to the best of his discernment; but in the exercise of the influence of will over will, the party under command, whether of superior or inferior intellect, is prohibited from exercising any choice whatever.

The mode of election procedure pursued in the British system of representation, by giving full scope to bribery and intimidation, has placed the power of electing representatives in the hands of a very few, as compared with the whole bulk of the community.

The number, too, even of illusory electors, is considerably contracted, by an adherence to qualifications established centuries ago, and little suited to the existing state of things.

It is a fact not denied by those who are most hostile to any alteration of the present system, that a majority of the House of Commons is returned by about 71 peers and 91 commoners; and that a small proportion of the whole community contributes to return the remainder.

In a legislature so composed, the portion or party of it not in place may be steadily opposed to the party in place; and yet little or no advantage to the com-

munity will result from such an opposition. Such an opposition cannot consult the interests of the community without lessening the amount of profit in expectancy, should it succeed in supplanting the party in place. To this end, attempts will be made to throw discredit on the party in place, in various ways; but both parties will, by tacit and often unconscious assent, abstain from introducing any plans which may materially tend to lessen their actual or expected profits in misgovernment, while that misgovernment will be carried just as far as shall be possible, without endangering the safety of the ruling body.

The evils, however great they are, would have proceeded much further, but for that degree of freedom of the press which exists contrary to law; and the publication of the debates, which takes place contrary to the standing orders of the House; and forms, therefore, no part of what some persons call the *Constitution*.

The immediate knowledge of what is going on, and an occasional clamour of indignation, give the people, under another form, a portion of that control which it cannot be pretended they have in their representative system. Members who seat themselves in the legislature, or who are seated there by a few powerful families, are, as far as representation is concerned, thoroughly independent of the people.

But, as it is plain, from the continued existence of jobbing and depredation, that public opinion, even aided by a partially free press, is not a sufficient safeguard for the interests of all, no adequate remedy can be expected till the power of choosing their representatives is vested in a considerable portion of the people.

Any plan of reform which fails to attain this end, may be considered as altogether nugatory.

Having premised thus much, our inquiry now is, as to the plan proposed by Lord John Russell in the last session of parliament. That plan is as follows:—

“ To take a certain number—for instance, a hundred—of the small and decayed boroughs, and to allow them to return only one member, instead of the two which they return at present. The vacancy which would be thus created in the representation, would be filled up by adding to the number of representatives for counties,

"and also by giving the right of representation to the large towns, which have grown up in different parts of the country\*."

The object of this plan probably was, to increase the number of electors; for Lord Althorp, the seconder of the motion, said, "the present state of the representation was such, that the people had not that preponderance in it which was necessary to secure them the certainty of being well governed." It will, however, be no difficult task to shew, not only that the plan could produce no such effect, but that it would render matters much worse than they are at present.

From each of the corrupt boroughs, the members are returned, for the most part, by a single elector; that is, the patron or proprietor of the borough, or the purchaser of the seat for the time being. It is true that a few of the burgesses who inhabit the place, go through the ceremony of giving a vote; but the vote, as far as it purports to be an indication of choice, is altogether illusory—the choice being made by him who gives the pittance which their poverty impels them to accept.

But the members for the counties also, are seldom returned by more than one or two real electors. The great mass of county voters,—the farmers and tradesmen,—are absolutely compelled, on pain of losing their farms or their principal customers, to vote for the candidate whom the great landholder elects. Precisely the same effect is wrought among them, by intimidation, as is wrought among the inhabitants of the borough by bribery. The half-starved burgess renounces his vote to gain five pounds; the farmer with ten children renounces his vote, lest he and they should lose all means of subsistence; the end attained in both cases is the same—the renunciation of any kind of choice; but of the two instruments employed to attain the end, bribery is by far the less pernicious. By bribery, the end is attained without pain; the briber receives his value in return, and the party bribed is satisfied with his bargain; but by intimidation are engendered the feelings of a *tyrant* on one side, and the feelings of a *slave* on the other: and as to the demoralization so exclusively imputed to bri-

bery, it is not easy to comprehend why it should be worse to do a given act, on an agreement to receive money, than to do it on an agreement not to lose.

It seems, then, that as long as the landholder is enabled, by the present mode of election procedure, to put in force the *great engine of intimidation*, no accession will be made to the number of real electors, by taking from the boroughs and adding to the counties a certain number of representatives. Such a measure will only enable the great landholder, who at present returns one member, to return two, and will prevent the great moneyholder from returning himself.

This would certainly be a change for the worse. Not only would the painful process of intimidation be substituted for the less objectionable process of bribery, but a greater number of representatives would be returned by a class of men whose interests are more irreconcilably opposed to those of the rest of the community than the interests of any other class whatever.

Under good legal institutions, it might be possible to give the lawyer an interest in the dispatch and cheapness of suits, perhaps as great as he has now in their delay and expensiveness. Under good ecclesiastical institutions, it might be possible, (as it has been shown to be, in Scotland), to make the clergy render service commensurate with the amount of revenue they enjoy. But it seems impossible, under any circumstances, that the owners of land should not have an interest opposed to that of the community.

It is obviously the interest of the community that the price of raw produce should be as low as possible; but, as the rent of the landlord must increase in proportion as the price of raw produce is high, he has a direct interest in every measure which tends to raise it as high as possible: therefore, if there were no other objections against them, the interests of the landholders would render them, as a class, the most dangerous to be entrusted with the interests of the community; but, in other respects, they appear also singularly unfitted for the province of legislation. Born to hereditary wealth, and without exertion secure of every enjoyment, which the mass of mankind can only attain by patient toil, they are deprived of the most powerful incentive to undergo the labour necessary for the so-

\* *Ibid*, p. 580.

quirement of knowledge, while they have every inducement to pursue an opposite course. To men of ordinary minds it is indeed much pleasanter to spend the morning in hunting, and the evening in dining and dozing, than in a laborious search for truth, or any serious exertion of the mental faculties; but we may be fairly excused for doubting whether the difficult and extensive questions of state policy can safely be handled by those whose time is passed in frivolous amusement. To attempt to play the fiddle without previous instruction, would be esteemed the height of presumptuous folly; at least, then, we may suspect that the science of legislation requires some training, and that men do not acquire political wisdom by intuition. Such is the supposition we should make *à priori*, and such is the fact as borne out by all experience. There is scarcely an instance of a country gentleman having distinguished himself in the houses of Parliament except as an opponent of almost every species of improvement; the members remarkable for knowledge and talents have almost invariably been returned for the boroughs.

To take, therefore, from the boroughs the privilege of returning representatives, and to vest it in the counties, would, under the present system of election procedure, in no wise contribute to the only effectual reform of the representative system—the increase of the number of electors: on the other hand, it would greatly augment the mischievous influence of a class whose interests are more than those of any other class, opposed to the interests of the community: it would substitute for the evil of bribery, the greater evil of intimidation; and it would narrow the only entrance by which, as things stand at present, men of talent can find admission to Parliament\*.

It can hardly, however, be believed, that means might not be found by which the number of real electors might be increased on transferring the right of suffrage from the boroughs to the counties, and by which the disgraceful tumult of elections might be altogether avoided.

\* Let us not be mistaken, or supposed to preach up hostility to landholders merely because they are landholders. Their existence as a class is an inseparable incident to property in land: all we desire is, a vigilant eye to their proceedings,—all we deprecate is, investing them with any extraordinary degree of political power.

Until secrecy of suffrage, or, as it is commonly called, voting by ballot, shall have been tried, it would be presumptuous to affirm that there are no means of increasing the number of real electors, and equally presumptuous to affirm that elections cannot be conducted without tumult, until they shall have been carried on concurrently in small electoral districts; for instance, in every parish, or even in every town.

It is not necessary, upon the present occasion, to enter at large into the objections commonly urged against the ballot.

It has been shown that security for good government cannot be attained except by creating a numerous class of electors; it has been shown that in a country where a few are very rich, and the great mass of the community are comparatively poor, it is impossible to have a numerous class of real electors while the suffrages are given openly: either by intimidation or bribery, the actual choice will remain in the few.

Unless, therefore, the inconveniencies apprehended from the ballot can be shown to be greater than the sum total of the evils experienced from misgovernment, they ought to be submitted to, supposing them to exist, for the sake of attaining a paramount good,—security for good government; and it is incumbent on those who reject the means thus offered for attaining this end, to show that such means are objectionable, or that others less objectionable may be found.

What, however, are the objections commonly urged?

1. That the ballot would not ensure secrecy.

2. That it is derogatory to the pride and dignity of an Englishman to have recourse to concealment in order to escape oppression; and that he is not fit for free institutions unless he is willing to be ruined in support of them.

3. That secret procedure would destroy all interest in elections, and all public spirit.

That there would exist a class of imprudent persons, who, notwithstanding the protection held out to them by the ballot, would by indiscreet avowals expose themselves to the enmity of the powerful, may perhaps be at once admitted. But the legislator's inability to shield the imprudent from the effects of their own indiscretion, is no reason

why he should not afford to the prudent all the protection in his power. As there must always be a certain portion of mankind incurably weak, it would be as absurd to abandon attempts at general improvement, because this portion cannot be protected against its own folly, as to relinquish the encouragement of vaccination because a few bigotted and prejudiced old women persist in propagating the small-pox, or to omit building parapets on a bridge, because madmen will sometimes jump over them. Let the legislator do his best to establish good institutions, and there can be little doubt that the majority of mankind will be ready to profit by them.

The second objection being of a sentimental nature, and not referable to the standard of utility, (which proposes to attain, for the aggregate of society, the greatest amount of pleasure, and the greatest exemption from pain,) is only advanced by those who have some other standard of good and bad than the standard of utility:—as they have no where informed us what this other standard is, it is not easy to reason with them. It can only be observed generally, that there is nothing bad in secrecy of itself;—secrecy is good or bad according to the purposes for which it is observed. Secrecy with regard to matters confided to our knowledge, under injunction not to reveal them, is esteemed a virtue; secrecy in the proceedings of courts of justice is esteemed an evil, because, by exempting the judges from observation and responsibility, it holds out temptations to misconduct: but secrecy of suffrage at elections of representatives is asserted to be good, because it may shield the poor man who chooses to think for himself from the oppression of the rich.

As to the alleged degradation incurred by a resort to secrecy, it is not easy to comprehend why it should be esteemed more degrading to *do* as we like under condition of silence, than to *say* what we like, under condition of *doing* what we dislike.

With regard to the last part of the objection,—admitting, for the purpose of argument, the baneful proposition, that good institutions ought not to be accorded to any but those who are willing to sacrifice themselves to obtain them, there is a large mass of every

community to whom the proposition cannot apply. A man may be ready to sacrifice himself in support of his opinions, but he may think it too much to sacrifice a wife and children.

The third objection is perhaps soonest answered by a reference to the fact, that in those numerous provinces of the United States of America in which election procedure is conducted by ballot, no lack of interest on the subject of elections is observable,—no decline of public spirit.

As for those who profess to apprehend danger to the institution of property from that extension of *real suffrage* which would necessarily ensue upon procedure by ballot, they may be challenged to produce a single instance in the history of the world in which the institution of property has failed to command respect at the hands of the mass of mankind. Conflicting parties have occasionally confiscated the possessions of obnoxious individuals; or have abolished inexpedient modifications of property, as Henry the Eighth abolished the monasteries; but the people, even when most ignorant and most provoked, have never been betrayed into any general attack on property, nor is it their interest to commit such an absurdity; for if property were disregarded, they must suffer more than the rich whom they attack. “Take away all public protection of property, and the rich man immediately finds himself at the head of an association, whose interest leads them to respect proprietary rules among themselves, and to violate them with regard to any one else. There is no person, except himself, whom all the members would concur in reverencing as their chief: but the poor man, when the public safeguards of property are withdrawn, cannot make it the interest of any body to maintain its laws towards him. He is perfectly isolated and defenceless, and stands exposed to plunder and slavery, from the powerful associations in his neighbourhood. Let no one imagine that, because he is poor, he is, therefore, an object not worth aiming at. His labour is the most valuable of properties, and he is inestimably the most profitable of all domestic instruments\*.”

\* Statement of the Question of Parl. Reform p. 70.—Baldwin, 1821.

Conformably to these principles, in every country where there is no law of property, the rich man is a despot, and the poor man is a slave. In England, five or six hundred years ago, the property of the feudal baron was secure and terrible, while the poor villein had no protection even for life.

With respect to the other part of Lord John Russell's proposal, namely, to give to the large towns a portion of the members taken from the decayed boroughs, it may fairly be apprehended for the large town as well as for the county. Without ballot, the number of real electors would not be increased; in the large town, as in the county, the member would in effect be returned by one or two powerful individuals, whose interests perhaps would not be so much opposed as those of the landlords to the interests of the community, but who nevertheless would have an interest of their own distinct from that of the community, and that distinct interest they would, in the long run, assuredly pursue. Further than this, a greater course can scarcely befall a town than the privilege of suffrage, under the procedure of open voting, and tumultuous and protracted election. The tyranny exercised in harassing small shopkeepers to vote contrary to their inclination, on pain of losing their customers; the abandonment of principle to which the poorer sort are tempted, by the prospect of a little money to relieve present necessities; the demoralization of the labouring class, and the annoyance to the more peaceful and respectable citizens by the violence, tumult, and debauchery of a contested election, constitute a frightful mass of evil.

But how much of all this evil and inconvenience might be removed by ballot and simultaneous election in every parish! Whatever may be alleged as to the inefficacy of ballot to secure secrecy, can it be believed that any man would lay out money in bribery, when he could have no means of ascertaining whether the vote was given according to agreement? could riot or tumult take place, if the election, instead of being extended over ten or twelve days, were commenced and terminated in half an hour? if the voters, instead of being called together in one vast mob, were dispersed each to the separate polling booth of his parish, or street?

It is to be feared, however, that they who resist such expedients have no wish

that election tumults should be repressed, no wish that the numbers of real electors should be increased.

The riot and tumult which they so carefully cherish, affords a pretext for saying, as many say, that the mass of the people are too ignorant and brutal to be entrusted with the choice of representatives; that, in order to secure the influence of property, the real choice ought to be vested in a very small proportion of the whole community, and that a degree of what is termed public spirit, sufficient for checking the tendency to misgovernment, may be generated and sustained by the septennial or triennial tumult of contested elections, as now carried on.

As to the degree of information requisite, we have before shewn that nothing more is needful than for the people to know who among them are most in esteem for the acquirements and integrity appropriate to a member of parliament; and that a tolerably civilized people does not possess this degree of knowledge, has no where been proved or asserted.

The plan for keeping up public spirit, or a love of liberty, as it is sometimes called, by periodical saturnalia, it is past our faculties to comprehend. The class who are led into the excesses of such occasions, are generally the least informed, the least reflecting, and the least virtuous of the whole. If by public spirit be meant a regard for the general interests of the community, including one's own share thereof, such regard may exist among the sober, peaceable, and industrious, but can never be found among the drunken and profligate. In proportion, indeed, as the people have advanced in education, the debauchery, tumult, and violence of elections have greatly subsided; the class by whom such disorder is continued is become exceedingly small; and yet it will scarcely be affirmed that public spirit, or a vigilant eye to the abuses of government, is less manifest at the present than at any former period of our history.

To the doctrine that a regard for the influence of property (which must mean, if any thing, a regard for the protection of property) requires the real choosers to be few, though the illusory voters be many, an answer has been already given.

But the less experienced ought to be put on their guard against the ambiguous extent of this expression, Influence of property, in the mouths of certain people,

is a phrase employed to conciliate and win over to their views the possessors of large property, of whatever kind. Such is the thing expressed, and such the object of the expression;—the thing meant is, not influence of property, but influence of landed proprietors. That the influence of property at large is not the thing meant is perfectly clear, from the hostility shewn to bribery, and the indulgence shewn to intimidation.

If those who hold this language were sincere in their wish, that property at large should have an influence which they would deny to intellect, they could never object to bribery; for there are no means by which the possessors of property can exercise a more direct influence, than by purchasing whatever they desire; and we have shewn that the exercise of influence in this way is less mischievous, less painful, than in the way of menace. Nevertheless, our statute book teems with laws against bribery; our parliamentary and county orators are unceasing in their invectives against this fearful exercise of the influence of property; against the justice of paying a man for surrendering his will to the will of the payer, we have penalties and denunciations without end; while, against the injustice of compelling him to act contrary to his will, from apprehension of being stripped of the means of gaining a livelihood, we find not a single enactment, we hear not a single protest. On the contrary, a large class of public writers have openly contended, that, if the tenant will not vote as his landlord bids him, it is perfectly just that the landlord should take advantage of any delay in payment of rent, or other breach of covenant, to eject the tenant from his farm; and it is a fact too notorious to be denied, that, upon such occasions, that course is frequently pursued.

The influence of property, then, means the influence of landed proprietors; an influence, as we have already shewn, the most opposed of any to the interests of the community, and therefore the most carefully to be watched and circumscribed.

Having examined somewhat in detail Lord John Russell's plan of reform, and the objections commonly advanced against the only accompaniment of the plan which could render it other than pernicious, it will not be necessary to enter at length into his speech. What is remarkable in it, is, the sort of argument

selected as most likely to make an impression on the House. He asserts, pretty openly, that the election of members is in effect vested at present in a few persons; he asserts that the interests of the many are sacrificed to the interests of the few; but he calls on the House to assent to his plan of reform, not so much because he considers it calculated to secure the interests of the community, as because it would be a return to a supposed ancient order of things. "In asking for a reform, therefore, I ask but for a restoration of our ancient rights\*,—I only propose to return to the original constitution,—I ask only to place the House of Commons in the same state in which I have proved it always ought to have continued\*."

The real question is, what institutions are necessary for the security of the people of the present day?—If we can decide on that, it seems immaterial whether or not they agree with the institutions of five hundred years ago. The employment of such irrelevant arguments, shews at least the opinion the speaker entertains of his audience, and how incompetent he deems them to think, or act, except upon authority and precedent. Nor is he single in this opinion. Mr. Peel, in his great speech upon the amendment of the criminal law, does not venture to rely half so much on the expediency (not to say the necessity) of the change, as on the authority (certainly, not a mean one) of Lord Bacon.

In like manner, Mr. Hobhouse, in this debate, says, that the reformers only wish "to recover for the people that control which is by right theirs; and to give them, by restoring the House of Commons to its original purity, the only real security for their persons and their property." But, in the course of a very long speech, he has no where explained that the people are misgoverned because their interests are at the mercy of a few, nor what are the means by which they may obtain security. So far is he from suspecting the real cause of all the mischief, that he says the restored dynasties on the Continent have made successful inroads upon the pockets of the people; "not because they have been aided by the aristocracy, but because they have no aristocracy to oppose

\* *Ante*, pp. 578, 579.

them. There is not in France any "body of men round which the people can rally themselves and stem the torrent of power; and, as the landed estates in that country are cut, as it were, into shreds and patches, and are undergoing a perpetual subdivision, there are no individuals of sufficient importance to make head against the dispensers of the favours of the crown."

Now, since the world began, can Mr. Hobhouse point out an instance in which an aristocracy have ever aided with the people to make head against the dispensers of the favours of the Crown, or to shield the people against the oppression of the Crown? It is true, that aristocracies have occasionally been at variance with, have occasionally thwarted, the monarch; but always for their own purposes,—always to redress some injury done to their own body, or to obtain some immunity,—and never with any view to the benefit of the people.

To go no further than the range of Mr. Hobhouse's speech;—he complains that the increased influence of the Crown has rendered unavailing all the efforts of the Opposition to check abuse. But what has caused this increase in the influence of the Crown,—and what are these efforts of the Opposition so highly extolled by Mr. Hobhouse? The influence of the Crown has increased, because the House of Commons has never interfered to check its increase—because the persons returning a majority of the members have found a decided interest in promoting its increase; a proof of all others the most conclusive, that the House, as at present constituted, does not represent the people. But, taking the fact to be as Mr. Hobhouse states,—taking this influence to be irresistible, and all opposition in the house fruitless,—if the aristocracy, who have created this influence, were by a miracle to repent of their misdeeds,—if they really wished to side with the people against the dispensers of royal favour,—if they were a body round whom the people could rally to attain the ends of good government,—what course would they pursue? Would they waste their time and strength in divisions confessed to be unavailing,—divisions on mere details of state economy? Would they labour to relieve the people from one-hundredth part of all the evils complained of, and leave untouched the continuing cause of still-

increasing mischief? Would they not rather seek to establish some great principle,—to point out, with a precision beyond dispute, the origin of the grievance, and apply themselves to effect the only remedy, by vesting in the people the choice of their own representatives?

But what is the fact? Upon questions whether 5 or 10,000*l.* a year, more or less, shall be granted to certain branches of the Royal Family, or twice as many hundreds be added to the salary of a minister; upon all questions, in short, which may discredit the ministry for the time being, and give the party who are out a hope of succeeding to their places; upon questions which may have an air of importance, without the least chance of producing any advantage to the mass of the community, we find these members returned by the aristocracy, according to the language of Mr. Hobhouse, "glued to their seats;"—"the evening sun goes down on their hostile array," "and when he arises in the morning he shines upon their undiminished ranks;" they "despise hunger and thirst for conscience sake\*;" the speakers are numerous and eloquent, and the divisions at least respectable: but let the question be one of principle; let it be a proposal to give the people the choice of their representatives, and thereby to stop, in the gross, the extravagance so loudly complained of in detail, and where are the speakers, where is the eloquence, what are the divisions? The speakers, as on the present occasion, three or four!—the question withdrawn!—the division not requiring a teller; while the ministers, perfectly satisfied that upon these occasions, at least, their opponents are not in earnest, scarcely deign to enter the house, and leave the whole debate to Mr. Denison, Mr. Ross, and Lord Glenorchy!

It is not necessary to suppose that this course of things is premeditated, or that there is any actual combination amongst the members to avoid entering on discussions of real importance to the public. The state of their interests is, of itself, sufficient to produce such a result, and it is probable that a considerable proportion of the House is unconscious of the secret springs by which it is actuated. By a kind of instinctive consent both parties abstain from entering on topics

---

\* *Anti*, p. 585.

likely materially to affect their immediate or prospective interests, and in the absence of such topics naturally attach a disproportionate degree of importance to others in which the public are less concerned.

Thus Lord John Russell, no doubt with the best intentions, brings his whole force to bear against the detestable sin of bribery, introduces new bills, and after much labour induces the House, with the help of the Speaker's casting vote, to pass resolutions expressive of their abhorrence of the practice, anticipating from such fulminations the best possible effect at the ensuing elections! But if the House, instead of being chosen by the people, must be chosen and returned by an aristocratical few; bribery, instead of being the cause or aggravation of the evil, is however objectionable in itself, less objectionable than the tyranny of intimidation. But upon the evils of intimidation, by which so large a proportion of the community are compelled, without any compensation whatever to do the same thing, as the portion bribed,—to vote against their conscience,—Lord J. Russell says not a word: with regard to the parties who pay for the violation of conscience which they occasion, his indignation and apprehensions know no bounds: with regard to the parties who compel the same violation and pay nothing, he is as mute as if no such practice existed.

We are far from thinking or saying that Lord J. Russell does not intend to befriend the people: we merely express our doubts as to the utility of the measures which he proposes.

As to the debates on these bribery bills and resolutions, it is difficult to read them with gravity. Edifying indeed it must have been to have heard Mr. Brougham, in his capacity of lawyer, seriously expounding to the House, how "the practice of paying the electors after the election, though unconnected with any previous promise, was illegal:" how, "he had no doubt of its being an act of corruption, and of gross illegality;" how, "it was extremely desirable that the opinion of the House should be taken on that motion; if the opinion of the House, or even of a large portion of the House, was in favour of it, he thought it would have a good effect upon elections:" how, "he looked with anxiety to the interruption of the practices going

"forward in all quarters, which that motion might occasion\*."

Interruption, indeed! though we would not venture to ask such a question, Mr. H. Gurney immediately afterwards asked, "was there a member in the House who did not believe that every person who held a seat in that House must pay for it?" Every, was certainly six too many; for up got six immaculate members who loudly declared their innocence; but the man must be gifted with no small portion of faith who can believe that notwithstanding the *brutum fulmen* of the resolutions against bribery, the late elections have in any respect differed from those which have preceded them. If Mr. Brougham would really suppress bribery, let him propose the experiment of ballot; the impossibility of knowing whether any return is obtained for money paid, will do more to prevent the payment than all the penalties and resolutions that the most indignant legislature can frame.

By ballot too, he might at least give voters a chance of escaping the tyranny of intimidation; and what would be gained by repressing bribery, if intimidation still enabled the aristocracy to name the members of the House?

To get rid of bribery alone, would no more increase the security for good government, than to reform the Burgh of Edinburgh alone; a plan which was proposed by Mr. Abercrombie just before Lord John Russell's motion, and which was equally rejected by the House. But had the measure been adopted, it is not easy to see what the nation would have gained, (although it is very easy to see what the citizens of Edinburgh would have lost,) while the great body of the community remains without any share in the choice of representatives, and consequently without control over those who are returned by a few.

Such were the plans of reform proposed in the last session, and such the result. That they have failed, can never be matter of regret: nor, after the preceding exposition, can it be necessary to ask why they have failed. They who have already the privilege of choosing members in their own hands, and of dividing among themselves the profits of the adventure, are not willing to extend the privilege, and to surrender or diminish their share

\* *Ante*, p. 572.

of the profits. This, of course, is too broad "for ears polite", and other reasons, other arguments, must be advanced, against any proposal for alteration. To examine those arguments in detail would be a useless waste of time, but to state a few of the more prominent may be not altogether uninteresting or uninstructional.

Mr. Canning, in the Edinburgh reform debate, asserts that there is no grievance in the state of the representation\*. Does he believe, that if the members of the House were chosen by any large proportion of the people, the younger sons and dependents of the aristocracy would be provided for, as they are at present, out of the pockets of the people? Can he deny that this, though no grievance to the aristocracy, is a grievance to the people? He asserts, that if there be grievances, the attempt to remove them would produce a still greater evil: does he adduce or attempt to adduce any proof of this? Will he say that the ballot and simultaneous election would not deprive the few to a great extent, of the exclusive privilege of choosing; and can he point out any evil in a change which would leave the externals of the Constitution the same as at present in every respect, except as to election tumult?

He asserts that the country is prosperous under the present system. But what answer is this to those who assert that, under a popular representation, the country might be *more* prosperous; and where does he show that the country prospers, not in spite of, but in consequence of aristocratical dominion?

As to the jokes about a Scotchman's having the hardihood to call for a reform at Edinburgh, when he himself sits for a close borough in England, they could have no other object than to divert attention from the question in debate, and are as unworthy of serious notice as they are of the character of any man who is in earnest about truth.

Mr. W. Dundas deserts the question for the same brilliant *argumentum ad hominem*\*; he is also, with Sir G. Clerk†, very animated in defence of *chartered rights*. But what idea does the hon. member affix to the word rights? What are *rights*, but *means* devised by law for attaining the *end* of public good. The savage is without law, and conse-

quently without rights, and without security; but if the legislator of a civilized people has mistaken his means, and ignorantly or inadvertently conferred rights which do not conduce to the end he desires, is he to persevere in his mistake, and sacrifice the end to preserve the means? Cannot the power which confers rights, modify or abolish them as convenience or necessity may dictate? Mr. Dundas has, under the law of his country, a right to his house and his garden; a chartered right if he likes, secured to him by the *Great Charter*; but will this prevent, or ought it to prevent the commissioners under the New Street Act from entering upon his garden, and pulling down his house, if public convenience shall require it? The public can no longer be deceived by this stalking-horse kind of argument.

But Sir G. Clerk says, that if these rights be attacked, there is no knowing where innovation may stop. Where will the new street stop? Where convenience and use require. If the commissioners were to attempt to pass that boundary, would not the general outcry of the neighbourhood arrest their operations? and why should it be assumed that the members of the House of Commons are more imbecile than the neighbours of the new street?—for the argument amounts to this—'Even though the present measure should be objectionable, you must reject it, for it would lead to the proposal of others; and you are so stupid or so undiscerning, that if you permit this to pass, you would not have the sense to reject others, though they should be never so objectionable.'

Mr. J. E. Denison, in the debate on Lord John Russell's motion, tells us that ministers are reforming abuses, and that, therefore, parliamentary reform is unnecessary. Nobody can be more ready than ourselves to give credit to the present ministry, whenever they deserve it; but the mischief of a Parliament constituted as ours, is, that in proportion as it is obedient to ministers in almost every measure which can be injurious to the community, in the same proportion is it disobedient in measures which are fraught with any extensively good results. To obtain majorities for passing bank restrictions acts, or for increasing public expenditure, is a matter of no difficulty;

\* *Ante*, p. 569.

† *Ante*, p. 560.

but no sooner is an endeavour made to give the nation the benefit of a free trade in corn, than the whole host of landholders rises up in wrath; ministers tremble for their seats; upon one excuse or another, the measure is postponed from session to session, and the power of the aristocracy wielded to the defeat, even of the influence of the crown, and to the general injury of the community. This, however, is probably what Mr. J. E. Denison approves of under the name of the influence of property; in America, he tells us, property loses its influence, and is less respected than here\*. As we have never heard of any thing like a disposition to impugn the institution of property in America, or any complaints of insecurity of ownership, even among the back settlements, we conclude that when the hon. gent. says property, he means *men* of property who have no claim to respect but the purses which they brandish; indeed, he is constrained immediately afterwards to admit, that by some means, the system there "*works well*." We can scarcely wonder at his inability to comprehend what the means are, when we find the following passage in the New York Gazette of October 13, 1824.

"Messrs. Stanley, Wortley, and Denison, Members of the British Parliament, have arrived in Boston from Canada, on their way to New York. These gentlemen travel too rapidly to obtain any very accurate knowledge; if their object is merely amusement, that may be answered."

Mr. Ross, with whom we shall conclude, has a very short argument against those who call for any better security for good government. According to him, none but the ignorant classes desire any change; "those who are most distinguished for the virtue and quiet of their lives, the dignity of their characters, and the splendour of their talents, are opposed to the change which it is sought to introduce†." We are at a loss which most to admire, the modesty, impartiality, and truth of the assertion, or the relevancy of the argument; answer, of course, we can find none; and we must, therefore, leave the enthymeme to those among whom it will, no doubt, produce a deep effect—the virtuous, quiet,

and talented class—who draw so largely on the purses and patience of the community, and for whose use, it seems to be established, the community was created.

#### *Summary Review of the Conduct and Measures of the Seventh Imperial Parliament.*

IN taking a view of the proceedings of the late parliament, and considering effects in conjunction with their causes, we shall presume, that our readers are aware of the acknowledged principle upon which all our reasoning, with respect to the actions of men, and our rules for modelling their conduct, are founded.

That principle is, that men are governed by motives: this is only saying, in other words, that they are governed by their interests; and it will best suit the expression of those reflections, which will occupy the subsequent part of this disquisition, to use the former of these terms in place of the latter; the interest being the primary thing—the motive only secondary and derivative; the interest, the actuating ingredient—the motive, but the view which the mind takes of the interest.

We desire to avoid all controverted points on this subject, and merely to explain distinctly the sense in which we wish to be understood. Thus, if any one should insist upon it, that men are not universally governed by their interests, and that many men, in many acts of their lives, act from sympathy, and the dictates of virtue, in opposition to their interests, we are not at all disposed to controvert their opinions, because there can be no doubt, that in the sense in which they understand the words, their proposition is true, how much soever it disguises the real nature of the phenomena.

It is not less true, with respect to every man, that, of the whole actions of his life, by far the greater number are determined by views of interest, in the ordinary sense of the word; the allurements of pleasure, the aversion to pain, the desire of wealth, power, reputation, and so on: nor, with respect to a large body of men of any description, that of their actions, upon the whole, interest, in this very sense, will be the governing principle.

\* *Ante*, p. 580. † *Ante*, p. 582.

When men are combined into an acting body, and have a kind of principle of unity bestowed upon them, it is universally recognized, that the interest of the body is the ruling principle of action. Their sympathies are with one another, not with those exterior parties whose interests come in competition with theirs. And as for virtue, in their case, who knows not, that in most minds, virtue consists in doing good to those with whom we sympathize? If there is any class of sensitive creatures, totally removed from our sympathies, we little regard the effects which our actions may have upon them.

This doctrine, which it would be highly instructive to illustrate at greater length, we must take as conceded. In truth, to deny it, would be to deny the very principle upon which government is founded. The principle upon which government is founded, is, that men, generally taken, will not only prefer their own interests to those of other men, but, when they can, will sacrifice the interests of other men to their own. Government, in all its shapes, is but an organization of means for checking the operation of this propensity; in most instances, it is true, a wretched organization.

In considering, in a general point of view, any part of the proceedings of the parliament of England, the House of Commons, of course, is the first object of attention. It is not incumbent upon us here to explain in what manner the House of Commons has become the main spring in the government of England: it is sufficient for us to recognize it as the fact—a fact, neither disputable nor disputed.

From the mode in which the suffrage for members to the House of Commons is distributed, and in which the business of the election is performed, it has been found possible and easy, for the leading families in the country, to establish such an influence over the electors in all the counties, and in a great proportion of the towns, that they can return as members for those places, the persons of their choice. This they do for one parliament after another, without end. And this, it is evident, is nomination—hereditary nomination, under certain forms—which, though at times they are troublesome and expensive, are, nevertheless, deemed necessary, in order to disguise the reality under false appearance.

There may be some doubt as to the precise extent to which this virtual nomination is carried. But for the settling of this dispute, any portion of the time of our readers or ourselves would be unprofitably bestowed. There is no doubt that it extends to much more than a majority of the members; and this is all which it is material to know. Whether the minority consists of a few less or more, is not of the smallest consequence with regard to the general nature and tendency of the acts of the assembly.

Of that portion of the House of Commons, which is not returned by the leading families, the greater part consists of men of large fortunes, who can afford, by dint of money, to create a temporary influence in those places where no great family has established a permanent one; and, in a few places, the election is made under more or less of the real opinion of the electors; their opinion of the fitness or unfitness of the individual to whom their votes are tendered.

Of those two portions of the House of Commons—that which is nominated by the leading families, and that which is not nominated by them—the latter is that alone about the nature and force of whose actions any doubt can exist.

The matter of fact and experience is, that of the members who do not sit by the nomination of the leading families, the greater number are prone to act along with them, and pride themselves in holding a place in their ranks. As far as these men are concerned, the interest which shapes the actions of those who are nominated by the leading families, does not experience opposition, but support.

When a legislative assembly is so composed, that one interest actuates one portion of it—another, another; but one of these portions is a great majority; it necessarily follows, that the interest of the major part is that which predominates in the whole. Whatever proposition, favourable to their own interest, the major part wish to carry, they always can carry, notwithstanding any injury it may import to the minor part, and the rest of the community, and notwithstanding any opposition which it may be in the power of the minor part to make to it. On the other hand, any proposition which the minor part may introduce, however conducive to public good, the major part, if it threatens

any infringement of their advantages, have at once the motive and the power to throw out.

In a legislative assembly, in which the great majority are leagued in the aristocratical interest, the situation of the minority, who represent the general interest, whether, in point of numbers, they are considerable or inconsiderable, is not that of legislators. It is mere imposture to call it so. Their combined votes in favour of any measure, to which the aristocratical interest are opposed, are wholly ineffectual to carry it. Their votes, in favour of any measure to which the aristocratical interest are inclined, are useless, because the measure would be as certainly carried without their votes, as with them. Voting, in these circumstances, is wholly without effect. It is, therefore, a mere nullity. As well might a man act the farce of voting in a desert, where there is nobody to see or to hear him. But if the voting of the minor part in such an assembly be a mere nullity, their speaking is not. They may still advocate good measures. Their place, therefore, in the legislative assembly, is that of legislators in form only, and with a fraudulent effect. They have but one real function—that of advocates for the general interest; and they would be much more favourably situated for the performance of this positive service if they were relieved from their mock character of legislators.

As the character, then, of the English House of Commons is, beyond all controversy, that of an aristocratical hereditary assembly, with a few advocates of the general interest, allowed to be heard among them, we are a little prepared to judge what sort of actions are to be expected from them; and, in reviewing the proceedings of the last parliament, to shew pretty accurately the connexion between causes and effects.

It must be supposed, that by a legislature, in which the aristocratical interest had so long and so largely predominated, the machinery of government, and all its workings, would long ago have been put into the state the most favourable to the interests of the aristocracy, which aristocratical wits, matched with the circumstances of the times, could bring them to; and that in this state they were found at the commencement of the last parliament.

This being the case, it is impossible not to see what must have been the predomi-

nating purpose of that assembly, throughout: that it must have been, to keep things as nearly as possible in the state to which they had been brought; and if an appearance of doing something must be kept up, to make as much of a little as possible; to put the advocates of improvement always on a wrong scent, and to listen to the proposition of no change that implied any real alteration.

When the powers of government are placed in the hands of a few—be it an aristocracy, or a despot and his satellites—these powers are rendered subservient to the interests of those who hold them, by the command which is thence obtained over the persons and properties of the rest of the community. The main object of such governments is to carry that command to as great a height as possible.

The ancient laws of England afforded protection to the persons of the mass of the people only to a certain extent; beyond that point every thing was open to the hand of power. Manners, however, in modern times, have done more than legislation for the protection of the lower orders from outrage in their persons. The man with power does not find his gratification in offering indignity or doing harm to the person of the man without power. What he desires, with respect to him, is command over his services. But command over his services is better obtained in the indirect, than the direct way; by first taking from the man his money, and after that, with his money, purchasing his services.

The aristocracy, then, have felt but little interest in recent times in deteriorating the state of the law in regard to the protection of the persons of the people. They have shewn enough, indeed, of reluctance to part with any portion of a power capable of being abused, though now seldom turned to a wicked account, and have resisted every proposition for the improvement of the law in this respect.

In modern times, the machinery of taxation has been found the most commodious instrument for making power useful to those who hold it. The power enjoyed by a particular class, of making laws to take so much annually from the property of every man, was the power to distribute a great part of the proceeds among themselves. This is a machinery which we may conclude has every where

been worked to the utmost. But no where has the working been so prodigious as in England.

The great evil of this mode of satisfying the aristocracy with the property of the people is, that it takes from the people more than it gives to the aristocracy, and carries the oppression of the people to a much greater extent than the mere enriching of the aristocracy would require.

For taxation, pretexts are thought necessary. The people are not told that they must be taxed, because the aristocracy want more of their money. They are told that they must be taxed, because the wants of the state must be supplied. And then those wants must be turned to the best account, and exaggerated to the utmost. All the establishments of the state are pushed to the greatest extravagance which the spirit of the times will bear. Civil boards and civil officers are multiplied without end. Army and navy are kept at the highest amount, for which a pretence can possibly be invented. And colonies and distant possessions are multiplied, both because lucrative places may be made in them with profusion, and because they afford one of the best pretexts for keeping up an expensive army and navy.

It is through these establishments chiefly, that the aristocracy pocket what they do pocket of the public money. But for every pound which they get to themselves in this manner, many pounds are extorted from the people. A regiment of soldiers benefits the aristocracy only by the pocketings of a few of its highest officers: it grinds the people by the cost of the whole machine. In like manner, a ship has only a few good things for the aristocracy: a vast amount of charge and oppression to the people. A colony has several good places fit for the aristocracy: it almost always lays an enormous expense upon the nation.

No event in the annals of the human race ever enabled a government to carry expense to so extravagant a height, and so to glut the possessors of power with the property of the people, as the war waged against the French revolution. In the few years which had intervened from the termination of the war to the opening of the last parliament, patience had been demanded for the time necessary to wind up the affairs of the war. The grand spectacle during that parliament is, to see  
Sess. 1826.

the struggle that was made to keep up establishments as nearly as possible to the scale even of the late destructive war, and to prevent the reduction of expense. In the year ending the 5th of January, 1820, the year in which the late parliament began to sit, the expenses of the civil list, military establishment, civil government, and collection, amounted to 26,600,519*l*. In the year ending the 5th January, 1826, the last of which the accounts can yet be adduced, the same expenses amounted to 29,157,171*l*.

The connexion here between causes and effects, is both obvious and instructive. The state of expense—that part of the working of the machinery from which more immediately the benefit of the aristocracy proceeds—had been carried, by the aid of a most extraordinary conjunction of events, to a degree of perfection altogether unexampled, and far beyond what the most sanguine hope could have anticipated. The situation of the aristocracy was the most advantageous possible: the grand concern was, to preserve it from deterioration. It is impossible for us to follow in detail the persevering efforts which were made by Mr. Hume, occasionally aided by a few others, only to curtail this expense, to cut off a few of its more monstrous deformities. Year after year did he make his expositions; year after year, not only were they met by an overwhelming opposition, but they and their author were treated with hostility. Every species of ill usage which experience had found the most successful in driving men from the post of duty in that House, and which few men indeed have had the magnanimity to withstand, was employed against him. After a time it was found, that a man had at last appeared, upon whom the ill usage of the House had little effect. This was a great point gained. This itself constitutes a new era. This is what they call a pregnant example. The spirit of Mr. Hume will pass into others. We shall have a race of Humes.

In the monstrous expense of this government, what is to be deplored, is not so much the amount of the property of the people which goes into the pockets of the aristocracy. This the people, without any very great diminution of their happiness and prosperity, could bear. This, great as it is, considered in itself, is small compared with the expense which is

wasted upon establishments, rendered enormous, that the places which they afford to the aristocracy may be as numerous as possible. The grand practical evil of our Government is this: that they who substantially wield the powers of it, have an interest in making its establishments too great. Establishments too great are, in modern times, and under the control of modern manners, the grand instrument of oppression to the people. It is in this, more than in any other way, that governments are bad; and that one is more or less bad than another. What was it that rendered Louis the Fourteenth the scourge of France, and before his death brought that kingdom to a state of exhaustion? Read his historians. They tell you with one voice. The extravagance of his establishments, military and civil, was the cause. The effects we know. The monarchy struggled on through a few years of languor and decrepitude; and expired in violent convulsions.

Such is the history of the late parliament, with regard to one branch of the public interests—the rate at which the people pay for the services of Government. The protection of the persons and properties of the people of England, is paid for at a cost of 57,000,000*l.* per annum: of which 29,000,000*l.* is for immediate charge; 28,000,000*l.* is for interest of the debt contracted for that protection at former times reputed extraordinary. Think of the end as it really is, in its own nature. Think next of the facility of the means,—justice, police, and security from foreign invaders. And then think of the oppression practised upon the people of England under the pretext of providing them. The expenses of Queen Elizabeth's government amounted to 500,000*l.* per annum. The comparison is said to be ridiculous. Why? Our courts of justice in England cost even now but 66,000*l.* per annum. Our police costs but a trifle. And why our shores should require a single man to guard them more than in the time of Elizabeth, we shall get not one good reason from those who will use the most swaggering asseverations on the subject.

Of the great interests of the country, that which stands first in importance is the administration of justice; the perfection of the means which are employed for giving certainty and security to the rights of individuals. The means conducive to

this end are comprised under three heads: diminution, to the greatest practicable extent, of doubtfulness relating to rights; a correct and prompt solution, without burthen to the parties, of such doubts as cannot be precluded; and, as often as any infringement of a right is incurred, an effectual remedy for the evil.

There is something remarkable in the history of law. We can expect nothing else than that the benefits of law in a rude age should be very imperfectly enjoyed. First of all, little is done in an age of ignorance, for narrowing the ground of doubt with respect to rights. Such an age cannot define. A few rude marks grow into authority by custom; and things are or are not recognized as rights, according as they do or do not bear the established indications. Little as a rude age is capable of defining, it is not less incapable of separating, by abstraction, the end from the means; and forming a clear and distinct conception of each. It is incapable of taking such a view of the *end*, as to comprehend in it every thing which belongs to it; separate from it every thing which does not belong to it: and such a view of the *means*, as to distinguish the steps which are necessary from those which are not necessary; and to mark in what possible order the smallest number of steps will suffice. The people of such an age employ ill comprehended means for the attainment of an ill comprehended end. They proceed in the way which wise men of the present day call practical: they see only a bit of a thing at a time. Accordingly they have a little expedient for one bit, and another little expedient for another bit. The consequences are, a want of connexion, and mutual bearing to a common end, among their expedients; a frequent clashing and counteraction among them; and a most unnecessary multiplication and complexity; one narrow expedient being provided for one narrow purpose, and another for another; when, under a comprehensive view of means and ends together, one expedient would have been found to accomplish many purposes. Such is the mode of proceeding of a rude age in all things. There are abundant reasons why it should be such in the business of law to a remarkable degree, and should produce a more absurd and fantastical product than in any other department of human affairs.

The astonishing thing with respect to law, is, that in a concern in which improvement so deeply affected the interests of all, the barbarous product of a barbarous age should have been protected from change in almost all countries, and handed down to a late and civilized age in a state of more perfect preservation, than any other monument, not physical and indestructible, of rude antiquity. Of all countries, England stands foremost in the merit or demerit of this monstrous preservation. If any one desires to have an accurate, and as it were a living image of the mode of thinking and acting among our barbarous ancestors, he has only to look carefully into the law.

It is a remarkable case of a remarkable part of our nature, that when people have never known the time in which they were without a certain suffering, they regard it as a part of their lot, and cease to think of its removal.

That the expedients of law in England do answer their end most miserably, is proved by such astonishing results, as one would imagine could not but make an impression upon the minds of the most stupid and apathetic people on the face of the earth. Whereas justice, to entitle it to the name, ought to be administered promptly, there is enormous delay in all cases: in a large class of cases such delay as amounts to a denial of justice. Whereas justice, to entitle it to the name of justice, ought to be cheap, (for dear justice is robbing justice,) the costs of law in England are ruinous, and exclude the great body of the people from its protection. And, whereas one of the great ends of law, is to remove uncertainty from rights, the uncertainty which attends them in England is such, that of the owners of land, a small proportion only know whether they hold their property by a good title or not.

The disgraceful manner in which the legislature of England have gone on from parliament to parliament, and from age to age, leaving all the load of evil, implied in such a system of law, to press upon the community, without a thought of its removal—nay, with an almost constant opposition to every attempt for relieving them of some of the more galling portions of it—has a more immediate connexion, we think, with the intellectual state of the two houses, than the moral. Though it cannot be denied that the

leading classes have an interest, to a certain extent, in the badness of the law—for a perfect law by yielding protection to the poorest man, exempts him from the power of the rich, and an imperfect law which denies him protection, leaves him at their mercy—in England, in this case, manners have to a great degree supplied the place of law, and it is but rarely that such oppression, as it is always in the power of a rich man to perpetrate upon a poor man, is seen to take place. There is another feeling, however, to which we are inclined to attribute a considerable effect. When an aristocratical legislature, by the constant tendency of ages, have got the machinery of government into a state of working as favourable to themselves as circumstances will allow,—when of course the grand principle of their policy is to keep the working as it is, and prohibit change,—they are afraid that an alteration for the better in the law, though it could be made with many advantages to themselves, as well as to the community, might bring other changes after it which would be less agreeable. Not seeing any necessary connexion between changes in the law, and changes in that part of the working on which their advantages depend, they have yet so strongly associated the idea of the changes which they deprecate with that of change in any department of government, that it is never raised in their minds without calling up at the same instant the idea of the changes they detest, and all the horror with which it affects them. Nor is it in this shape alone that intellectual inaptitude has contributed to produce that aversion, manifested by the English legislature, to the discharge of one of its primary duties; that of relieving the community from the evils of a system of legal expedients, most wretchedly adapted to their end. The greater number of those who compose the legislative assemblies of England, are not accustomed to the business of thought and reflection at all. Beyond the sphere of ordinary talk, and a very narrow and superficial observation, they are conscious of mere mental vacuity. A comprehensive view of the great subject of law—distinguishing accurately the ends which it is destined to attain, and of the means for effecting these ends selecting the best, and combining them in the most perfect order—they find a task as little suited to their

criminal law was declared to be destitute of a secondary punishment of any efficacy; from which it followed, on the one hand, that a great many persons were punished with death, who ought not to be so punished—an atrocious barbarity; and on the other, that a much greater number, the authors of those offences which most frequently, and, by their frequency, to the greatest extent disturb the security of ordinary life, pass without a punishment, other than a name: and while, along with this disgraceful acknowledgment, the further acknowledgment was made, by the mouth of the prime minister himself, that he was ignorant of any remedy for all this evil—there was before him, and before the legislature whom he addressed, an instrument of punishment, capable of being graduated, from the least to the greatest severity, and exquisitely adapted to attain all the ends of punishment, without one exception, and with the smallest possible cost to the public—the Panopticon prison and Penitentiary House of Mr. Bentham—the nature and properties of which had been urged with perseverance upon the attention of parliament for a number of years.

The history and fate of Lord Althorp's bill for the county courts, would afford important illustrations of the turn of mind which predominates in our legislative assemblies. But, as it would require to give this history in the requisite development, a space which we cannot afford, and as we have touched upon the nature of the subject both in our former and our present volume, we shall here content ourselves with one or two very general observations.

This was one of the best aimed endeavours which had ever been made for a reform in the law—a reform, which, if it had been effected as it ought to have been, would have annihilated a great mass of the evils, with which the state of the law burthened and afflicted the community. The object was to afford a cheap mode of deciding pecuniary claims, of that moderate extent, which it was better to abandon, than incur the infamous costs, which follow a suit in the courts. It was no longer time to refuse absolutely to entertain such a project. But let any reflecting man first consider within himself, how a virtuous legislature would have acted on such an occasion;

with what cordiality it would have embraced the object; how heartily it would have exerted itself to render the proposed remedy as perfect as possible, and to give its remedial operation the greatest possible extent; next let him contemplate, not merely the total absence of any thing like a disposition to aid the author of the bill, but the chicanery which was employed against it, the processes of mutilation and deformation performed upon it, and the rejection which it finally experienced,—and we leave him to draw the conclusion.

The other proceedings of the late parliament, on the subject of law, were either of so little importance, as not to deserve particular mention, or took place during those two last years, which fall within the period of our annual Review, and have been made the subject of separate articles. The debates on the question—whether counsel should be allowed to prisoners on trial for felony, afford the only particulars on which a remark or two appear to be required.

In civil cases, in cases of high treason, and in all the less highly penal of criminal cases, the defendant is allowed the benefit of counsel, not only in questioning witnesses, and affording advice, but in addressing the jury, and making his defence. To this latter purpose he is not allowed the aid of counsel in cases of felony, although counsel are employed to address the jury against him. This is one of those gross anomalies in the law of England, at which Englishmen are not shocked, only because their law is made up of such things. The first motion for leave to bring in a bill to remove this anomaly, (for the motion was repeated before the end of the parliament,) was rejected by a majority of eighty to fifty. The mover announced that the body of lawyers was opposed to him, though two lawyers of eminence supported him. Sir John Copley (Attorney-General) was the prominent actor on the opposition side\*; and the reasons which he adduced, were those which, probably, with or without his suggestion, swayed the minds of the majority.

First of all, the number of members present, is a circumstance, the import of

---

\* *Hansard's Debates*, ii. 205, April 6th, 1824.

which deserves to be well understood. The Attorney-General began his speech by declaring, "That this was indeed no light or trivial question, but one of the gravest importance." Of the House of Commons only 130 members showed by their presence that they had the smallest concern, whether this important question was determined one way or another. Four-fifths of the House were pursuing their business, or their pleasure, elsewhere. It should seem also, that "a question of no light and trivial nature, but one of the deepest and gravest importance," required, and deserved, some time for consideration; yet 80 members out of the 130 present, decided that none should be bestowed upon it. After hearing a little vague and superficial talk, the House came to a determinate conclusion on the spot.

The argument of the Attorney-General, divested of its amplifications, and enforcements, was, that the defendant would suffer more by the reply of the prosecutor's counsel, than he would gain by the speech of his own. He declared that in civil cases, the speech of the defendant's counsel, by entitling the plaintiff's counsel to speak after him, was to such a degree an evil, that it greatly vitiated that branch of the law. And he asked, whether "it was to be desired that the defect of our civil should be introduced into our criminal system."

The first remarkable thing to be noticed in this argument is, that it passes condemnation on the speeches of counsel, and declares that in all cases, both civil and penal, unless for questions of law, they are hostile to justice. In penal cases it is the best course, he says, that the counsel for the prosecution should open the case, that is, state to the jury the question which is to be tried before them; and that there should, after this, be no speech; nothing but the hearing of the evidence, and the summing up by the judge. He also says, that this, in civil cases, would be a course better adapted to the ends of justice, than that which is at present pursued. The only speech, therefore, not detrimental to justice, according to Sir John Copley, is that opening speech of the counsel, for the party defendant, in which the question to be decided, is stated to the jury. But the statement of the question to be decided is a function which ought not to be entrusted to the extemporary imperfection, or studied unfairness, of a party and his

agent. This is an essential part of the duty of the judge, to be performed, as far as possible, by a proper instrument in writing, completed, when any thing farther is necessary, by the oral exposition of the judge.

That the speeches of counsel impede the course of justice, was, at any rate, a decision which it was not right to adopt without mature deliberation. It was not a question which ought to have been decided upon the mere *ipse dixit* of the Attorney-General, in opposition to all the evidence implied in the established practice of this and all other countries. The House of Commons did decide that the speeches of counsel are a nuisance in judicature. It is the duty of the House of Commons, if any thing which concerns the public be its duty, to remove nuisances from judicature. From that time to this, has any thing been done to relieve justice of what was thus voted a nuisance by the principal branch of the legislature? From that time to this, has that same branch of the legislature any farther troubled its head about the matter, than to reject the same motion, in the same manner, when brought forward once more by the same author?

One thing, at any rate, few will dare to dispute—that if speeches of counsel be good for justice, all cases ought to have the benefit of them; if bad, all ought to be delivered from them. The Parliament of England takes a course entirely its own. Till it can make up its mind upon the matter, it divides the field of law into two portions—not very equal ones, it is true—in the one of which it gives the use of speeches, as if they were good; in the other, denies the use of them, as if they were evil.

In the cases, however, in which we say, that it gives the use of speeches, we ought to say, that it gives a mutilated, lop-sided, unfair, and partial, use of them. It gives the full use to the plaintiff's side; the garbled use to the defendant's side. Not only two speeches are given to the plaintiff's side, while one singly is allowed to the defendant's side, but the plaintiff is allowed the benefit both of the first word and the last; the consequences of which are important. According to the Attorney-General, it is the last speech which decides the question. He did not indeed say, that it does so always, nor did he say how often. But unless it does so in

a great proportion of cases, his argument, that the speech of defendant's counsel would do him harm, because it would allow the prosecutor's counsel to speak after him, was nothing to the purpose.

Because none but a lop-sided use of speeches was given by English law, in other cases, the Attorney-General concluded, with true lawyer's logic, that none but a lop-sided use could be given, if given at all, in cases of felony. Nobody asked—yet it was not a very recondite question—Why a lop-sided use of speeches in this case? If the counsel of the prosecutor has made his speech to support, and the counsel of the defendant has made his speech to invalidate the charge, why not do one of two things—either stop the speeches there; or, if the plaintiff's counsel be allowed a second speech, allow a second to the defendant's counsel also? There would be fair dealing in this. In the existing course there is the reverse.

If it be asked, how in our courts of justice, plaintiffs came to have so many indulgences, the answer presents itself immediately—The plaintiff was the customer. No wonder if it was thought right to give him encouragement. It was given to him to some purpose. The Attorney-General declared, that "the odds were *always* in favour of the plaintiff."

On the great, the master subject—the right composition of the legislature—no proposition was discussed in the last parliament, which, even if carried, would have altered the relative state of the private and public interest in the House of Commons—would have given to the public interest that ascendancy which the private has hitherto enjoyed.

Two schemes of reform were proposed, one by Mr. Lambton, and one by Lord John Russell; and on the last there were four debates in four different years. There was, besides, the disfranchisement of Grampound.

The main provisions of Mr. Lambton's bill were three.—1. Instead of the present election by cities and boroughs, which was to be annulled, election districts were to be formed all over England, in each of which one member was to be chosen; and all householders paying rates and taxes were to have the right of voting. 2. The representation of the counties was not to be altered, farther than by admitting leaseholders and copyholders to the right of

suffrage. 3. The duration of parliaments was to be reduced to 3 from 7 years.

The plan of Lord John Russell was shortly this: to take from one hundred of the smallest boroughs sending two members, the power of sending more than one; and to supply this defalcation, by one hundred additional members for the counties and great towns, in the proportion of 60 for the counties, and 40 for the towns.

The principle of sound decision on this great question, is obvious. Government is founded upon the necessity there is of preventing one man from promoting his own interest, at the expense of other men's. That men will do so, is not matter of doubt, it is matter of experience. The propensity is not confined to a few men out of many; to this class, and not to another. It is so nearly universal, that all our conclusions, with respect to men in bodies, are correct only in so far as they are grounded upon this experience.

The real object to be aimed at in the composition of a legislature, is to prevent the predominance of the interest of any individual, or of any class; because, if such interest predominates, the very principle on which government is founded implies, that it will be promoted at the expense of the community.

In the former part of this article, we have seen, that, in the composition of the English legislature, the predominance of the aristocracy is so complete, that whatever they wish to do, they always have it in their power to do—whatever they wish to prevent, they always have it in their power to prevent; that, by the bearing and impulsion of an aristocratical legislature for ages, in one direction, the working of the machinery has been rendered as favourable as possible to the predominant interest; and that, now, they who are in this interest have little else to do than to prevent alterations.

It follows, with the force of demonstration, from these unquestionable premises, that no change can, directly, be any improvement whatsoever in the British legislature, which does not substitute the predominance of the general interest to the existing predominance of a particular interest; and that no change can, even indirectly, be of any advantage, but such a change as leads to that substitution.

It is evident at the first glance, that the plan of Lord John Russell would detract nothing from the power of the aristocracy, who would nominate just as many members, after such a change, as before it. The chance is, that they would nominate more. The sixty members given to the counties would be theirs, without the smallest trouble, because the counties are theirs already. And can any body doubt, that of the remaining forty they would have their usual share? We deem it unnecessary to enter into farther development of the case, because we cannot conceive a man who will dispute our conclusion.

With respect to Mr. Lambton's proposition, we think it may not less certainly be determined, that it would not diminish, but increase the power of nomination, in the hands of the aristocracy. The only part of his plan which requires consideration is the first—the constitution of election districts, in lieu of the boroughs; for, that the annexation of leaseholders and copyholders to voters in the counties, would lessen the influence of the aristocracy in the counties, it would be ridiculous to imagine.

Now, the immediate effect of making election districts, in lieu of the boroughs and towns, would be, to add in each instance, a portion of the agricultural population to the town population. The agricultural population, the landed interest would command wholly; this would, therefore, be just so much added to that command over the town population which the aristocracy already possess. It may be said, that Mr. Lambton's plan gives a great extension of suffrage in the districts. But, besides that the suffrage in many of the towns and boroughs is already not much less extensive, it may be affirmed generally, that giving the suffrage to a more indigent class of people, without the safe-guard of the ballot, is only to place the election more completely in the hands of the powerful classes. And, with respect to the diminution of the time of parliaments, so long as a majority of members are nominated by a particular interest, what signifies diminution of time? If the same interest always predominates, will it not work as steadily in its own favor when the farce of election is performed every year, as when it is performed only once in seven years?

But, though a reform which would substitute the prevalence of the general interest to that of a particular interest in the legislature is the only reform which can *directly* be of the smallest advantage—it can hardly be affirmed of any change, which would not produce confusion, that it would not *indirectly* be of advantage; by leading the people to reflect more keenly upon the ends which are to be attained, and the means adapted to their attainment; by lessening the fanatical attachment to wrong combinations of means, venerable solely because they have long existed; by accustoming even the aristocracy themselves to perceive, that by such a change in the composition of the legislature as would give in it that ascendancy to the public interest, without which good government would be the most absurd of all expectations, they would lose nothing but that which they ought not to desire to retain; and would receive all the advantages of good government—advantages of unspeakable importance—in return.

All that remains to be remarked respecting these propositions is, the mode in which they were entertained by the House. As the ascendant interest would not have been injured by the direct operation of the changes, even if effected, the hostility of those who share in that interest is to be accounted for wholly by the indirect operation, of which they must have formed a very high estimate, unless we suppose them so ignorant as not to understand the nature of the propositions, and to have had fears on account of the direct operation itself.

Mr. Lambton began the speech by which he introduced his motion, with the following account of the feelings of the House\*.

"If at all times, and upon all subjects, I must be most unwilling to trespass on the attention of the House, on no occasion can I be more reluctant than on the present; and I can assure you that nothing but a deep sense of public duty, and an anxious desire to put an end to that spirit of discontent now so generally prevailing, would have induced me to take up a question, the great and important interests of which I feel that I am not competent adequately to protect. In the first place,

\* *Hansard's Debates*, v. 350.

"I know that I have to contend against  
 "that disinclination which has inva-  
 "riably been shewn by this House to-  
 "wards its discussion; a disinclination  
 "founded possibly on that dislike, which  
 "is inherent in all men and bodies of  
 "men, to hear accusations against them-  
 "selves, and statements of faults and  
 "corruption openly laid to their charge.  
 "If I wanted any evidence in support of  
 "this assertion—this well-known truth—  
 "I should undoubtedly find it in the  
 "state of the benches opposite to me.  
 "Perhaps, indeed, I should be justified  
 "in taking advantage of it, and at once  
 "submitting my motion to the vote.  
 "The result of that division clearly  
 "would be its adoption, for it requires  
 "no great discernment to perceive that at  
 "this moment the majority is greatly on  
 "the side of the friends of reform. But,  
 "Sir, I will not be tempted into this ir-  
 "regularity. If this scantiness of atten-  
 "dance is meant as an insult to myself,  
 "I treat it with contempt;—if it is  
 "pointed at the question, I then repel it  
 "with feelings of deep indignation; and  
 "can only hope that it will not be lost  
 "on the people of England." And to-  
 "wards the end of his speech, describing  
 "the treatment, which the applications of  
 "the people, for such a change in the com-  
 "position of the legislature, as would  
 "afford protection to their interests, were  
 "accustomed to receive from the majority  
 "of the House, he says—"They obsti-  
 "nately exclude the petitions of the pre-  
 "sent day. They heap on them every  
 "term of reproach which the ingenuity  
 "of wit, or the bitterness of sarcasm, as  
 "administered by the right honourable  
 "member for Liverpool (Mr. Canning),  
 "can supply. And then they express  
 "astonishment and alarm at the feelings  
 "which they hear repeated and re-echoed  
 "on all sides. To repress these, innum-  
 "erable acts of restraints and coercion  
 "have been proposed by them; and, of  
 "course, adopted by parliament."

The speakers after Mr. Lambton were,  
 Mr. Samuel Whitbread, Mr. Wilmot,  
 Mr. John Cam Hobhouse, Mr. Horace  
 Twiss, Sir Robert Wilson, Mr. Aber-  
 crombie, Mr. Fysche Palmer, Mr. Stuart  
 Wortley, Lord Bury, Mr. Martin, (of  
 Galway,) Lord Milton, Mr. W. Williams,  
 Mr. Honynwood, on the first night, (for  
 the discussion was adjourned); and on the  
 second, Mr. Wyvill, Mr. Sykes, Capt.  
 SESS. 1826.

Maberly, Mr. Ramsden, Mr. Harbord,  
 Mr. Ricardo, Mr. D. Brown, Sir G.  
 Robinson, Mr. T. Wilson, and the Chan-  
 cellor of the Exchequer.

These names are given for the sake of  
 the evidence with which the list of them  
 is fraught: though it is evidence only to  
 a point of sufficient notoriety—the feelings  
 of the House towards parliamentary re-  
 form. The question was decided by less  
 than one hundred members: Ayes 43;  
 Noes 55.

Of the allegations opposed to the mo-  
 tion by the Chancellor of the Exchequer\*,  
 the only one which bore upon the general  
 question, in such a manner as to deserve  
 remark, was this:—That public opinion  
 governs the House. This seems to have  
 become a pretty general resource with  
 the enemies of reform. They know not  
 the corollaries which are logically de-  
 ducible from it. But they cannot be ig-  
 norant, it is not conceivable they should  
 be ignorant, that what is thus asserted by  
 them is not according to the fact. That pub-  
 lic opinion is not without some influence  
 upon the House of Commons, is true.  
 It is not less true, that public opinion has  
 an influence, and a great influence, upon  
 the most despotic and barbarous govern-  
 ments on the face of the earth. Would  
 it not be shameful to infer from this, that  
 such governments are good governments?  
 Where the powers of Government are  
 wielded, as in England, by a particular in-  
 terest, it must of course observe public  
 opinion; it must study the arts of mis-  
 leading and eluding, and, for the purpose  
 of eluding, must occasionally obey, it;  
 though generally, and on all important  
 occasions, it may and does with security  
 brave it. That the House of Commons  
 is so governed by public opinion, as to  
 prevent the interest of the public from  
 being habitually sacrificed to the interest  
 of the class which predominates in it, we  
 should imagine is a proposition which no  
 man in his senses would stand forth and  
 affirm. Because, if public opinion be  
 all-powerful to secure good government,  
 what need have we of a House of Com-  
 mons at all? Would not a House of  
 Lords answer our purpose as well? Nay,  
 since it is matter of notorious certainty,  
 that the king's ministers are far more de-  
 pendent upon public opinion, than either  
 House of Lords or House of Commons,

\* Hansard's Debates, v. 451.

does it not follow from this doctrine, that the nation would be better governed if both House of Lords and House of Commons were put out of existence? Still farther, is it not clear, that, from the superior force with which public opinion does act upon the ministry, a revolution has taken place in the working of the Constitution? Formerly, the House of Commons was regarded as the check upon the king's ministers. Now, it is evident to all the world that the king's ministers are the check upon the House of Commons. And when the House has the appearance of being checked by public opinion, it is not in reality the House that is checked, but the ministers that are checked, and carry the House, by means which are no secret, along with them.—But the operation, present and future, of public opinion in the government of England, and the utter impossibility of its sufficing for good government against the established predominance of a sinister interest in the legislature, are important topics, the development of which cannot be undertaken in so limited a plan as that which at present we propose to execute.

On the first occasion on which Lord John Russell brought forward his scheme of reform (the 9th of May, 1821\*,) the speaking was left to himself; for, after a few words from Mr. Whitmore, who seconded his motion, the Parliamentary History says, "there was a loud cry of, 'Strangers withdraw!'" and after a very few words from Mr. Bathurst, and Mr. Barham, the House divided on the previous question: Ayes, 124; Noes, 155. The second occasion on which he introduced it was the 25th of April, 1822†, when the speakers, after himself, were, Mr. Horace Twiss, Lord Folkestone, Mr. Duncombe, Mr. Wynn, Mr. Robinson, Mr. Canning, Mr. Denman, Mr. Peel; and the division was 164 to 269. The third time was the 24th of April, 1823‡, when, beside the mover, the speakers were, Lord Normanby, Sir Edward Hyde East, Mr. Ricardo, Mr. Martin, (of Galway,) Sir John Newport, Sir T. Lethbridge, Sir F. Blake; and the House divided, Ayes, 169; Noes, 280. The fourth and last time was on the 27th of April, 1826||, that

is, a few weeks before the general election. The speakers on that occasion were, the Mover, Lord Althorp, Mr. J. E. Denison, Mr. Ross, Lord Glenorchy, Mr. Hobhouse, Lord Leveson Gower, Mr. W. Lamb; and the motion was negatived by a majority of 247 to 123.

One fact there is which cannot fail to excite the curiosity of many persons, the wonder of some, and the reflections of not a few. On all these discussions, on the vital question of parliamentary reform, the great Whig organs in the House were silent. Mr. Lambton, and Lord John Russell, men of great weight in their party, were left to fight, each his own battle, alone, or with some feeble support which chance alone seems to have presented them. This is extraordinary, surely. We must be curious about its meaning. Mr. Brougham was not present at the discussion of Mr. Lambton's plan; Sir James Mackintosh and Mr. Tierney were. And these three leaders were all present at three at least of the discussions on Lord John Russell's proposition. Their motives can only be conjectured. Did they not like to stake their reputations on inefficient reforms, which went to make change, without improvement? And did they not like to declare themselves for any such reform as *would* have been an improvement? The existence of such motives can easily be conjectured. But it is not easy to conceive, that such men should not have made the calculation how much it must affect the reputation of themselves individually, and of the party they lead, if a parliament of seven years should begin and end, without their having once unlocked their lips on the subject of Parliamentary Reform. Mr. Canning, with his accustomed alacrity of attack, presented them something to do. How does it happen that none of them has ever chosen to grapple with Mr. Canning on the ground of Parliamentary Reform?

Sir Francis Burdett was present, not at the discussion on Mr. Lambton's motion, but at three at least of the discussions on three several motions of Lord John Russell. Why had he not a word to say for his own "good old cause?" Mr. Hobhouse made a speech on Mr. Lambton's motion: from that time the example or precept, or both, of his leader, seems to have been fatal to him, and they were mute together, till the last debate,—that immediately preceding the general elec-

\* Hansard's Debates, v. 604.

† *Ib.* vii. 51.

‡ *Ib.* viii. 1260.

|| *Ante*, p. 576.

tion, when it must be allowed that the speech made by Mr. Hobhouse was a good one, by far the best that was delivered on the occasion. Are we to suppose, that the creed of Sir F. Burdett has been retrograde on the subject of parliamentary reform? Would he like to tread back some of the steps which he has taken? to disclaim some of the measures which he has recommended? If so, his abstinence from speech would not be unnatural, though it would not be very manly. Not unnatural; because recanting is not a very pleasant operation at best; and, besides, recanting, what has he to recommend him to the people of Westminster? Not manly, because, if he has changed his opinion, nothing is manly but declaring that he has done so. To shut one's mouth, and say nothing, is only a milder sort of hypocrisy, than continuing to profess the same opinions, while one feels and acts as their opponent. If Sir Francis Burdett has sat for seven years in parliament without so much as uttering a sentence in favour of parliamentary reform, though all his opinions remain unaltered on that subject, we profess that his conduct is to us inexplicable. To be in earnest about opinions of vast importance, and to make exertions for giving them effect, appears to us to be not two things, but one and the same thing.

So much importance is attached to the exquisite fencing of Mr. Canning in defence of the predominance of the predominating interest in the House of Commons, and so much sport is afforded by the stabs and slashes which he deals to those who draw their weapon against his *protégé*, that we cannot refrain from noticing the present performance\*; though it would require much more space than we can afford, to shew at large the disproportion of the means to the end. "If Troy could have been defended, it would have been defended by this right hand;" but the best of hands cannot perform impossibilities.

At an early age, Mr. Canning proclaimed himself the champion of the power of the aristocracy; and sedulously and successfully did he cultivate the talents which were best adapted to the task he had undertaken. As a man of ambition, he chose his walk with skill. By what other career could he have at-

tained the power and consequence to which he has ascended? This is one of the evils attached to the predominance of a particular interest in the legislature. The rewards it has to bestow, pervert, and draw off, from the service of the whole to the service of a part, some of the finest spirits which the country breeds. To how many, alas! the rebuke of Goldsmith to Edmund Burke, his friend, must continue applicable, so long as this state of the legislature endures?

— "Good Edmund, whose genius was such,  
We scarcely can praise it or blame it too much;  
Who, born for the universe, narrowed his mind,  
And to Party gave up what was meant for  
mankind.  
Though fraught with all learning, yet straining  
his throat,  
To persuade Tommy Townsend to give him a  
vote."

The evil is in the system; the men are the victims; and towards them, personally, our censure ought to be gentle, our regret sincere.

One thing remarkable on this occasion is, that Mr. Canning renounced entirely the tone of mockery and insult, which he had been accustomed to use towards the people, as often as a man was found who dared to stand up in the House, and meet the discharge of hostile feeling, which was sure to accompany the proposal of any such change as implied protection to the interests of the people. It is possible he had begun to see that, however entertaining this might be to an assembly of aristocrats, the time was come when it did very little good to their cause. It is also probable that he had become ashamed of so mean an exercise of his talent. When the people of Athens were applauding somebody for a panegyric of themselves, just delivered, Socrates asked the triumphant orator, "where the difficulty was, applauding the Athenian people, to be applauded by them? Get applause from the Spartans, (said he,) by eulogizing the Athenians, and I too shall acknowledge the power of your rhetoric." When an assembly of aristocrats, possessing all the powers of government, are intruded upon by somebody, demanding on behalf of the powerless part of the community, a participation in those powers; where, indeed, is the difficulty of making such an assembly merry at the expense of so disagreeable an applicant? No jest, however poor, which will not on such an occasion be

\* *Hansard's Debates*, vii. 106.

successful; no expression of contempt, however vulgar, provided only it is strong enough, which will not be felt as a stroke of genius. Our great dramatist told us truly, "that the prosperity of a jest lies 'in the favour of him that hears it.'" If Martin Luther, the monk, had appeared before an assembly of Leo and his cardinals, demanding the reform of the church in its head, and its members, what sport it would have yielded them to see him mocked, and evil entreated, and turned out, by the attendants. The lowest buffoon, in his holiness's kitchen, would have exercised wit upon him, oral, manual, or pedal, with triumphant success.

All this while would there have been any thing really ridiculous and contemptible in the great Reformer? No: there would have been nothing really ridiculous and contemptible, but in the pope, his cardinals, and the buffoon.

The speech of Mr. Canning, on this occasion, consisted of two parts. In the first, he made his objections to the plans of Lord John Russell and Mr. Lambton. In the second, he made his usual display against reform itself. In the first part, it was an easy task, to shew, as he did, the futility of the plans which had been just recommended; and that, being alterations the effect of which would be nothing, they deserved rejection, on the part both of the friends, and the enemies of reform. In the second part—the attack upon reform in the abstract—there is mighty little matter, but that little exceedingly well managed.

In beginning the first part of his speech, he availed himself dexterously of an admission of his opponent, who, stating that public opinion had acquired a great influence on the House, proceeded to say, that a greater obedience to the popular voice would not be beneficial; and called to witness the revolution, at which time, if parliament had not disregarded the public voice, the Stuarts, he alleged, would not have been excluded from the throne. The suggestion was not thrown away upon Mr. Canning. The game of the aristocracy was placed on both sides. Two things were assumed: the first, that a House of Commons, which will resist public opinion as often as public opinion is wrong, is absolutely necessary; the second, that a House of Commons, so constituted as to prevent the aristocratical interest from

predominating in it over the general interest, would be obedient to public opinion, even when wrong.

That a House of Commons ought to be so constituted as not to follow public opinion, when wrong, no one will deny; but they who urge the obedience of the House of Commons to public opinion, as a reason against reform, are in a dilemma. A House of Commons which can resist public opinion, when wrong, can resist it also, when right. The present House of Commons, they say, is admirably constituted for resisting. In that House, the interest of a particular class, predominates wholly over that of the community. It follows, from the present admission, that it has the power of resisting the public voice in favour of that interest. If so, the very principle on which government is founded, assures us that it habitually will. Bitter experience shews us, that it habitually does.

The second assumption is wholly unfounded. It is clear to reason, that a House of Commons, so constituted, as to give in it the predominance to the general interest over all particular interests, would not follow public opinion, when wrong; that it would be much less likely to follow public opinion, when wrong, than the present House; and that it would have such motives and such means to guide public opinion right, that no impulse of public opinion, wrong to any considerable degree, would, under such a House of Commons, be an event to be imagined, much less to be feared. The interest of such a House of Commons, would be the general interest. If the public voice ran counter to the general interest, would not such a House of Commons have all the motives to oppose it, which ever can be in a house—its opposition to the interest of those who compose it? The difference between the two cases turns upon a single point; but that is all in all. In the supposed house, the general interest would predominate; in the present house, it is wholly subordinate. The one house would have motives to use its power of resistance to the public voice, in favour of the general interest solely. The other has motives to use it in favour of the particular, to the detriment of the public interest.

When Mr. Canning comes to debate

the question of parliamentary reform in general, he is provided with what Lord Normanby\*, in seconding Lord John Russell's motion the following year, denominated very aptly "the stock declamation of the cause; the excellence of the government as it is; and the danger of change:" and, rich in this treasure, he goes in quest of nothing farther.

Of all the arts of the orator none is of more importance to him, than the art of insinuation. Of all the orators of the present day, perhaps of modern times, Mr. Canning is the man who has carried the art of insinuation to the greatest perfection. No man approaches to him in the command over forms of expression, which deliver in the oblique, whatever it would be less convenient to deliver in the direct way.

Of the things which it is much more convenient to deliver by insinuation than directly, are—propositions insipid from their triteness—and propositions which will not bear examination, though accustomed to be received without it. If Mr. Canning were to affirm twenty times in one speech—"The constitution is excellent; Alteration is dangerous,—without so much as attempting to offer any proof of his standing assumptions—not only would he produce no effect—except of weariness and disgust—but he would inevitably provoke the question, what evidence have we on which to rest our belief that these propositions are true? On the other hand, when, carefully avoiding any broad affirmation of his two indispensable postulates, Mr. Canning dexterously contrives to insinuate them twenty times in twenty different ways, and makes up a speech of these insinuations, and of nothing else; he produces a great effect, is supposed to have made, as he really has made, a very ingenious and brilliant display; and, what is of most importance, suggests no question as to the evidence of assumptions of which so extraordinary a use has been made.

It is necessary that we should shew the mode of putting the two propositions, which are the bulwarks of anti-reform, a little to the test.

*The government is excellent.* If by excellent, here, is only meant existent, nobody will deny the affirmation. The English government is what it is, most

assuredly. If by the same phrase is meant, that the English government is better than a worse government—this may be affirmed of every government in the abstract, and in the concrete of all except one. If it is meant that the English government is better now than it was at some former time, this also may be true; and still it may be very bad. If it is meant that it is better than any other government whatsoever, this is rather a bold thing to assume; but grant it, and still it may be true that the English government is thoroughly worthless.

In giving a meaning to this thoroughly unmeaning word, the only thing to the purpose would be—to shew that the English government is a combination of means well adapted to the end of government—namely, the equal and perfect protection of all the members of the community at the smallest possible expense. *A priori*, and looking at the end and the means, in their own nature, Mr. Canning seems to allow, that really nobody could take upon him to say, that the one is well adapted to the other. Nevertheless, he says, it so turns out, in fact—God knows how—that these means, ugly as they do look, still accomplish the end surprisingly well. The way in which he proceeds to make people believe him is admirable.

We felt the strongest desire to produce a collection of Mr. Canning's modes of expression on this occasion, and to shew their exquisite contrivance for making what is poor and trivial appear ingenious and strong. But we perceive to our regret, that the space which we are allowed to occupy, will by no means permit the attempt.

He affirms that under the English government, the English people have not only continued a people, but have been a happy and prosperous people. *Ergo*, he cries, the English government is an excellent government.

That the English people have continued a people is true. It is a dreadful government that suffices to destroy a people. This is too much for the government of Algiers itself. But the English people have been happy and prosperous. Have they so? And where is the people who have not been happy and prosperous? Is there no happiness and prosperity at Algiers? If we are told, as we shall be, that there is not so much at Algiers as in England, we desire to know what stand-

\* *Hamard's Debates*, viii, 1873.

ard is given us by which to judge. As it is not every degree of what may be called happiness and prosperity in a country which proves its government to be good, what degree are we to take, as the proof? Till you have settled that point, you talk in vain by repeating the word "prosperity." The prosperity you speak of may or may not be a proof of good government.

If they tell us, which they do, though not directly, yet by fifty modes of insinuation, that the prosperity of England is exactly the degree of prosperity which proves a government to be good; what is this but asking us to believe the government of England to be good upon their simple word? All we have to say to this is, that we will not take their word. The Grand Turk gives his people his word, and all his instruments give them their's, that they are the only happy people on earth, and his the only excellent government.

This hack pretension, which has served the purposes of mis-government for so many ages, deserves to be looked at in another point of view. The English people are the most laborious, the most enterprising, the most ingenious; in one word, the most productive people, in the world. The people of England have laboured,—the people of England have invented,—the people of England have produced,—the people of England have been saving, and have gradually accumulated the wealth, which, in this argument, is called the prosperity of England. Because the government of England has not been so execrably bad, as to take from the vast produce created annually by the people of England, so much as absolutely to prevent accumulation, though it has taken more than ever was taken by government, elsewhere, on the face of the earth, we are called upon to swallow this monstrous proposition—that what the people of England have done for themselves, their government has done for them. That produce, which is the work of the people's own hands; that produce which, but for what the government has so excessively diminished, would have been many times greater, the people are commanded, and in terms not very mild, to believe, has all been created for them by the government—for what reason, trow ye? For this sole reason, that it has not all been annihilated by it.

Because the energy of the people, to better themselves, has not been absolutely baffled, and borne down, rendered of none effect, by the badness of the government; they are told that the working of the government, how little soever any one, from its composition, would conjecture it, is nevertheless admirable; and they (the people) ought to go on supposing, as hitherto they have done, that whatever the government does not take away from them, it is the government which gives.

We come now to the second bulwark of anti-reform, the affirmation always given with greatest effect by insinuation—that *there is vast danger in change.*

This pretence is now so generally seen through, that we shall not think it necessary to waste words on it.

What the people of England want, is, such a mode of placing members in the House of Commons, as will prevent the predominance in it of any particular interest, and render predominant the common—the general interest. Why should this produce any evil? Why should it produce any thing but good?

When the aristocracy of England proclaim, that making such a change will produce terrific evils, they are either not sincere, or their words have this, and can have but this meaning,—that they, the aristocracy, will make a civil war, rather than give up those powers of misrule, which they are now in possession of. And if they do make a civil war, there is no doubt that they will create evil in abundance; but it will be evil, of which they themselves will be the authors, and the sole authors. The people, however, need not count the cost of a civil war, as the price to be paid for obtaining the predominance of the common interest, instead of the predominance of a particular interest, in the legislature of their country. The aristocracy of England will have wisdom sufficient to avoid that extremity. The voice of the nation, growing louder and stronger, "will," as Earl Grey on one occasion very happily expressed it, "in time work upon the prudence of the House;" and the requisite change will take place, with advantage to all, and evil to none; such only excepted as the very good which is aimed at implies—the loss of the profits of misrule, to those who had previously, and worthlessly, enjoyed them.

In these debates on Parliamentary re-

form, the speech of Mr. Canning, and the silence of the whig and radical leaders, were not the only memorable events. The accession to the cause of reform was then manifested, of three remarkable men—Lord Milton, Lord Folkestone, and Lord Normanby; of which noble lords the two former had the manhood to avow an entire change of opinion on the subject; and of the two, Lord Milton, at least, on more than one occasion, has shewn that he not only recognized a defect in the composition of the legislature, but knew the very nature and kind of the defect. Of all these events, the most intrinsically important was, the speech of Mr. Ricardo \*, on the third of the discussions on Lord John Russell's plan of reform. That speech went simply, and modestly, but manfully, to the point. Mr. Ricardo declared, that other things might admit of various modifications, but, to render that House an instrument of good government, two things were of indispensable necessity;—annual elections—and such a mode of voting as would make the vote of each elector his own;—the reverse of such a mode as renders the elector a mere conduit-pipe for the vote of another man, who, through hope of good, or dread of evil, commands him.

We must add something on the disfranchisement of Grampond; but many words, after what has preceded, will not be required.

A display of virtue, which costs nothing; an occasion for catching at the reputation of purity, without the loss of an atom of the delights of impurity, is a god-send to an old profligate.

With the exception of a number, comparatively very small, of towns in which the choice of the people does predominate, members are sent to the House of Commons, either by the influence of great men, who, singly, or in combinations, have established a permanent influence over the electors; or, by men of wealth, who, in those places, where no great men have established a permanent influence, find the means of establishing a temporary influence, and obtain their own return, on this or that particular occasion.—Permanent influence; or temporary influence—such are the sets of means in these two sets of cases.

Now this thing, called, in these several cases, influence, what is it? By the answer to this question, the obscurity which involves the subject, will be pretty completely dispelled. The answer too is obvious and certain. Money, or money's worth, is the motive principle in every instance. Ingenuity will torture itself in vain to give it the look of any thing else. What is the permanent influence of the great man over the occupier of his land in the country, or the occupier of his house in the town? The prospect of retaining a good thing, or the fear of losing it. And this good thing, in what way is it good, but the pecuniary way? What is the temporary influence of the man who gets a majority of the electors at a particular place to vote for him at a particular election? The benefit they expect to derive from him. That benefit takes various shapes; it is sometimes government patronage, sometimes East India patronage, sometimes the pocket of the candidate. In all cases it is money, either directly, or indirectly.

The motive of the man who receives money indirectly, and the motive of the man who receives it directly, is precisely the same. The motive of the man who gives money indirectly, and that of the man who gives it directly, is also precisely the same. The man who gets into parliament by the money given directly, and the man who gets into it by the money given indirectly, are in the same situation precisely, with respect to the motives for doing or betraying their duty to their country. The two cases, therefore, differ in nothing but the name. In no other department of human intercourse are they permitted to differ even in name. The judge who should take money indirectly, would be universally regarded as bribed just as effectually, and to the full as infamously, as if he took the money in his hand.

Why are they made to differ in name, and made to be thought different in nature, when a member of parliament is to be elected? Because it is the interest of the aristocracy that they should be so; and because the aristocracy have the power, to a great extent, of making what shall be the morality of the country; making it to serve their own turns.

The places in which the permanent influence is established, are all secured for

\* *Hansard's Debates*, viii. 1279.

the aristocratical interest; the places still open to a temporary influence, are the places not securely within the grasp of the aristocracy; and though, of the wealthy men who procure their election by the temporary influence, the greater number are sure to range themselves under the aristocratical banners, there are some who do otherwise, and a greater number who always may. It is thus evidently the interest of the aristocracy that, in the field of influence, the temporary part should be narrowed, and the permanent enlarged. This is the effect, and the only effect, of such a proceeding as the disfranchisement of Grampound. When Grampound was to be had for money, a competition among rich men decided the election, and the man returned might act with the aristocracy or against them. When the choice was given to Yorkshire, in which the aristocratical and permanent influence is established; or, even when the choice is extended to the surrounding hundreds, in which an agricultural population, dependent on the class of landholders, predominates—the sphere of the permanent aristocratical influence is enlarged.

Making influence, by money given directly, is rarely convenient to the aristocracy. It is the instrument of their competitors. It is that whereby interlopers encroach upon their monopoly. It is their interest, therefore, to decry it; and the power they have hitherto exercised over public opinion is signally manifested by their success.

They began, very wisely, with the potent machinery of names. They bestowed a bad name on the mode in which the pecuniary motive is applied by their opponents—the direct mode; a good name on the mode in which it is applied by themselves—the indirect mode. The first they called “Bribery.” The second they called “Legitimate influence of Property.” The effect of these names has been surprising, under the advantages with which the aristocracy have worked them. The one they loaded with every term of abuse: on the other they bestowed every epithet of praise. “Bribery” was abominable, execrable. The “legitimate influence of property” was every thing which was good. “The legitimate influence of property” was pure. “Bribery” was impure. These two words, *pure* and *impure*, were of singular value.

“Bribing” was not merely *impure*, it was *impurity* itself. It was that which made an election *impure*, and an *impure* election was a dreadful thing. *Impurity* of election was the source of all political evil. On *purity* of election, alias, “legitimate influence of property,” the liberties of England—those blessed, thrice blessed things—absolutely and entirely depended.

Incredible was the language of ignorance, or of imposture, held upon the said purity and impurity, in the discussions regarding this glorious specimen of legislative virtue—the disfranchisement of Grampound. In the meantime it is demonstratively, almost intuitively certain, that, if the public interest be the object in view, influence in the direct mode is the least objectionable of the two. If at each election the whole of the 600 and odd seats in the house were set up to sale, and knocked down to the highest bidder, the advantage in favour of good government would not be inconsiderable. We should then have what, if we use the language of the aristocracy, we should call a very impure election; but we should have a much purer legislature.

After the great points of national interest involved in the subjects we have been thus considering, we know nothing, brought before the last parliament, of greater importance, and nothing, the mode of dealing with which affords more perfect evidence of its nature and disposition, than the scheme proposed by Mr. Brougham, in one of its early sessions, for the education of the people. We can afford to bestow upon it only a few words; but these will suffice to renew the memory of the transaction. Mr. Brougham; whose merits on the subject of education his country can never estimate too highly, and who thereby has redeemed many of the sins he commits by his connexion with a party, in whose trammels, had he known the true interest of his own glory, he never would have consented to draw; was obliged, in order to afford himself a chance of carrying his measure in parliament, to grant so large a power to the established clergy in the management of the parochial schools, as alarmed the dissenters, and, from dread of unpopularity with the dissenters, detached the leading men of his own party from his support. We shall always regret, that he was thus compelled

to let a measure drop, which, though it came short of the perfection which, had he been at liberty, he doubtless would have bestowed upon it, would still have been a powerful instrument of improvement among the people. A legislature, in which the general interest predominated, would not, when a scheme, thus important to the public weal, failed, from peculiar circumstances, in the hands of an individual, have allowed it to sink and be lost. The only feeling natural to an aristocratical legislature on the occasion, was a feeling of pleasure at getting rid of so disagreeable a business.

Of the other subjects which came before the last parliament, as the most important, the Corn Laws, Ireland, Negro Slavery, Colonial Trade, and others, have been included in the business of the last two sessions, and been treated of in separate dissertations in our volumes of the last and present year, little remains on any of them, to be either explained or enforced in this general sketch.

In relation to commerce, the thing of principal importance to remark is, the extraordinary change from the policy of restriction to the policy of freedom; from the policy of discouraging, in many cases prohibiting, the supply of certain commodities from our neighbours, to the policy of receiving our supply from the places from which it is obtained at the cheapest rate; from the policy of trying to keep from our neighbours the use of our inventions, to the policy of allowing individuals to consult their own interests under the direction of their own judgment. In this, we have an exemplification of the fact to which we adverted in an early part of this dissertation, and of which the effects would require a more ample development than we can here afford, that the ministers are far more sensible to the action of public opinion than the parliament. The instructed and disinterested part of the public, had, for a considerable time, spoken a strong language on the subject of freedom of trade. This reached, at last, and bore along with it, the minds of ministers. They introduced into parliament, cautiously and timidly, a few measures in the spirit of this policy; but there they found it still required all their influence to overcome the ancient bias in a set of minds, on which the opinion of the rational part of the public had produced no impression

SESS. 1826.

whatsoever. What the ministers have yet accomplished, is small, in comparison of what remains to be done; and all their proceedings—witness the timber trade—have not been in the right direction: but they have proclaimed the principle of freedom, as the principle of true policy; and this itself, is a great step in advance.

One question, relating to Ireland, belongs peculiarly to this general sketch. What was the state of Ireland at the beginning of the last parliament, and what was it at the end? The state of it at the end, was not better, certainly, than it was at the beginning. And the state of it, during the whole time, as well as for a long preceding time, was so bad, that no pen can convey an adequate idea of it.

What is the meaning of this? The evils of Ireland are not absolutely incapable of a remedy. The peculiar evils of Ireland are such, as might unquestionably be removed.

We have the patient on the one hand—miserable Ireland: we have the doctor on the other—the British parliament. The doctor goes on administering his remedies: the state of the patient is never improved. What opinion are we to form of the doctor?

Ireland is a mine of instruction for the people of England. The British constitution, that “*tried establishment*,” as Mr. Canning calls it, of which “*the working*,” as he tells us, is so entirely to his satisfaction, Ireland enjoys in its perfection; king, lords, commons—all balanced to a hair.

There is considerable difference, if not in the mode, at least in some of the results, of the working in Ireland. What makes the difference? Till Mr. Canning afford the solution of this question, Ireland is the answer to that argument, which he draws with so much triumph, from the working of the British constitution. Why is Ireland not to be taken as the true example of the working? England as the example of a country, in which the vices of its government have been held in check, and their effects in some degree compensated by the virtues and the spirit of the people? One thing is certain, that the constitution works not less well for the aristocracy in Ireland, than it does in England.

The state of Ireland is such as would disgrace the legislation of barbarians.

The conclusion is inevitable; that the British legislature, paltering with this great subject; no less than the misery of millions, and the heaviest of the burthens of England; from year to year, from parliament to parliament, and from one age to another, without producing any salutary change; have either not the will, or not the capacity, to legislate usefully for Ireland.

Ireland affords the example of an aristocratical government, working almost perfectly free from check; an example, therefore, of its genuine tendency,—of the effects which it is the very nature of it to produce.

It is a rare combination of circumstances which exhibits any government acting without a check. The patience of the people can be counted upon only to a certain extent; and the chances, in an insurrection, against a bad government, are too serious not to be carefully shunned. Our experience of the barbarous governments of the East has yielded us light upon this subject. Though the people of India are passive to an extraordinary degree, it has always been found that the native governments, when the British government in India has undertaken to supply them with the use of British troops, have become ten times more oppressive than they were before; because, before, they were under check from the dread of insurrection; dependent upon the irresistible force of the British arms, they have nothing to apprehend, and set no bounds to their pillage and extortion. The case of Ireland resembles that of India in this as in several other respects. Had the aristocracy of Ireland been solely dependent on their own power, they could have proceeded in oppression only as far as the people would bear. Having the British army to depend upon, they could go on till they met with a check from the hand which upheld them.

The misfortune of Ireland is, that England has an aristocratical government, which, instead of checking, has sympathized with, the aristocracy of Ireland. The first principle, of course, of such a government was, that all insurrections of the people were to be put down at any rate. Whoever might be in the wrong, the people, seeking to right themselves, were always to be in the wrong. This was enough for the aristocracy, unless the government of the country was placed on

such a footing as to ensure order and justice, and to take the power of taxing, directly or indirectly, out of their hands. There is no one who will dare to say that this has been done in Ireland. The consequences are inevitable: the strong man has had the power of oppressing the weak; the strong men in conjunction have had the means of organizing a system of oppression, which has made Ireland, what it is; a spectacle of wretchedness, of immorality, of lawlessness, the like to which exists no where on the civilized earth. The aristocratical workings in Ireland, traced through their channels, small as well as great, exhibit our nature in one of the states physically the most deplorable, morally the most detestable, in which it is possible for it to appear.

On the one hand, *power* at work, sometimes with force, sometimes with fraud, to possess itself to the utmost of the produce of the people's labour, and to command their wills and services—on the other hand, *weakness* at work to protect itself from the ravages of power, or take vengeance on it for the evils it has made to be endured; at work, most frequently by fraud, by all the arts of disguise and mendacity, occasionally by terrible eruptions of force, put down by terrible exertions of force; with malignity and hatred continually engendered in the breasts of the oppressors against the oppressed, and in the breasts of the oppressed against the oppressors—produce a tissue of evils, the conception of which is surpassed by nothing but the conception of hell, and of the torments and passions of the damned. This is the point to which all bad governments tend; this is the end at which they certainly arrive, if they are not stopped in their course by some exterior cause.

It is a shallow view of the Catholic question, to take it in whole, or in the greatest part, as a religious question. It is an aristocratical question. The aristocracy, wholly Protestant, have been in the habit of considering the power of converting the mass of the people into a sort of outcasts, on the pretext of their religion, as an instrument of their ascendancy; and they contend accordingly with feet and hands for the preservation of it. They labour under a great mistake; for, however the pretext may have been useful at first in the consolidation of their power, they now would enjoy the

means of oppressing the population, emancipated, as they call it, in full as great perfection as non-emancipated. Would emancipation alter the state of rent?—would it alter the state of tithe?—two means, which, by the admirable working of the machinery in Ireland, enable its aristocracy to tax the people for their own benefit, without any limitation but what is physical; to take from them every thing but the potatoe, which is necessary to keep the wretches alive; often to leave them not so much of the potatoe as is necessary to keep them alive.

Why do we call the drawing of rent and tithe in Ireland the power of taxing? Because such is the state of the circumstances in Ireland that taxation is thus actually performed. We know rigidly what rent is. The poorest land in cultivation pays no rent; the land which is more fertile than this, yields a greater produce; and the difference between the greater produce and the least is the rent. In whatever country the landlords and titheholders have the power of taking more from the cultivators than this excess, they have the power of taxing. They do, in Ireland, take more. How is this proved? By this,—that the profits of cultivating the land, when more than this excess is not taken, suffice to maintain the cultivators in comfort, and enable them to accumulate stock. As this is not the case in Ireland, it is clear that the landlords and titheholders take from the cultivators in Ireland more than the rent; in other words, that they tax them; and we see to what a pitch of oppression their taxation is pushed. That there are remarkable exceptions to the general rule, is creditable to the individuals who make them—nothing at all to the system.

How the working of the machinery brings about this important result, it is not very difficult to understand. An ignorant, an over-crowded, and lawless population, (need we stop to explain how the Irish are ignorant, over-crowded, and lawless?) are always eager to possess a bit of land; for, miserable as the prospect which it yields, it is rather less precarious than any other property or source of subsistence. Such a people have no regard to their word, and never intend to fulfil more of any engagement than what is useful to themselves, if they can possibly avoid it. They care little, therefore, what they promise; and they

are always willing (such is the matter of fact) to promise more for the favourite bit of land than it can possibly pay. It is easy to see what power this bestows upon the landlord; it enables him not only to take the rent, but as much more as he pleases.

The state of the case between the titheholder and the landlord is this:—The titheholder comes first, and takes his share; and the landlord gets only as much as he leaves. It is said, that the titheholder seldom gets his full share. True; the matter is settled by a scramble between the titheholders and the landlords: a compromise is the result; and the titheholders, as being the weaker party, are obliged to allow something of a lion's share to their more powerful brethren in the chase. It is of no consequence to the cultivator. Taking every thing but the most miserable pittance, they can get no more from him: all being taken, a question of division only remains between themselves. If the titheholders were annihilated to-morrow, the landlords would get, in whole, that which they now get only in greater part. The condition of the cultivator would experience no improvement.

We look upon the propositions which have been made in Parliament for violating the contract between the nation and its creditors, and the countenance which such propositions have there received, in a very serious light.

At all times it was easy to foresee, that if ever an iniquitous legislature should harbour the design of cancelling the national debt, and committing a state bankruptcy, it would not perpetrate the deed at once; the shock would be too violent: it would accomplish its design by steps; first one, then another; and would always find some pretext, as plausible as possible, for proceeding to each.

Precisely in the way in which the first movement, if ever it were made, might have been expected to be made, have the incidents in Parliament fallen out. A defalcation from the payments due to the national creditor, not an entire abolition of his right, has alone been hinted at. To be sure, the defalcation is a large one,—very nearly one-third of all that is due to him; so that only two steps more would be required to take all, and cancel his claim entirely. An occasion, too, so little understood, and so easily

misinterpreted, as to be well adapted for furnishing a fraudulent pretext; a pretext which would wear a plausible outside, and could not without some patience be seen through, has been adroitly seized as the motive and reason of the first, and, of course, the leading, and most difficult step, in a national bankruptcy. One of the many odious products of the late most extraordinary war, is that to which we owe this pretext, and the precipitation, at least, of the proposition which it is employed to recommend. At a certain period of the war, parliament thought proper to suspend payment in cash of the notes of the Bank of England; and, under the fancy that great advantage was thence obtained in prosecuting the war, to pass a law continuing the suspension till six months after the conclusion of peace. The consequence was, that the Bank, no longer afraid of excess, so increased the quantity of its circulating paper as to depreciate the currency. Some time after the conclusion of peace, parliament applied itself to consider the state of the currency, and finally resolved on the resumption of cash payments, and the elevation of the currency to its pristine value.

It is from this last measure that a reason is sought for deducting 30 *per cent*—(we do not give this as the only, but as the most accredited proposal)—from the interest due to the national creditors. A good-looking name was needed. A name that shews the ill-favoured side of a project is injudicious. For the first step in the state-bankruptcy of England, a convenient name has been found in the words, *equitable adjustment*. The allegation is, that whereas the loans contracted since the suspension of cash-payments, were paid, some in a currency more, some in a currency less, depreciated,—a deduction equivalent to the greatest depreciation should be made from the interest, paid in the restored currency, not only on the loans advanced in the more, but those advanced in the less depreciated currency, and even on those advanced before the suspension, when there was no depreciation at all.

There is something at variance with moral feeling, and singularly discreditable, in this pretence. When a government is foolish enough, or wicked enough without the folly, to make a depreciation of the currency, it alters the state of pecuniary contracts, enabling the man who has a

payment to make, to satisfy the demand against him, with a less value than he contracted to pay. It thus produces a great amount of evil; but an amount many times less than what would be produced, if all contracts were on that account to be dissolved, and re-drawn on a computation of the value of the currency at different periods. This would throw society into an embarrassment and confusion inferior only to that which the dissolution of the bands of government would produce. The literal fulfilment of the contracts is therefore enforced, as infinitely the smaller evil of the two. Acting on the doctrine of the equitable adjustment, the legislature would relieve itself from those obligations which it binds upon the community. It would make a law in its own favour, in direct opposition to the law which it makes for all other parties in the like situation. It would stamp, by its own hand, the brand of iniquity upon one or another part of its own proceedings. It would exhibit the odious spectacle of a government holding one weight and one measure for itself, another for the community which it guides, and to which it ought to serve as a pattern of every kind of virtue; frugality, wisdom, benevolence, justice; not an example and incitement of every description of vice; prodigality, folly, disregard of public good, and injustice.

The pretence is as worthless, as the measure, which it is proposed to found upon it, would be flagitious. The fundholders, it is said, being paid interest in a restored currency, receive more than their due. This is wholly untrue. First of all, a great proportion of the national debt was contracted before the suspension of payments; and advanced in a currency of the full value. During the time of the depreciation, the interest of this debt was paid in the depreciated currency; was not paid in full; and on the principle of an equitable adjustment, a compensation is due. Mr. Maser has computed that compensation; and has shown that it would exceed the deduction which, on the same pretence, could be made from the interest payable on the debt contracted during the period of depreciation; that more, in fact, would be due to the first set of creditors, than from the second; that, allowing the principle of the equitable adjustment to be correct, government owes to the 174

tional creditors, as a body, more than it pays: so thoroughly unfounded and fraudulent is the allegation, that government may justly cut off 30 per cent from the interest of the national debt: in other words, commit a fraudulent bankruptcy, at fourteen shillings in the pound. We need not repeat, how easy the step is from fourteen to seven, and from seven to nothing.

The second reason, which shows that the equitable adjustment is founded in imposture, is as follows:—

When a contract is made by open competition, as were all the contracts for loans during the last war, the terms are of course as low as the circumstances of the case, all taken together, will permit. During the time when loans in the depreciated currency were made, it was the law of England that cash payments should be restored six months after the conclusion of peace. An act of parliament ordained the resumption. The faith of parliament was pledged for the resumption. When the legislature entered into contract for all the loans which were raised during the period of depreciation, it stood bound, it had strictly engaged itself, not rashly, not unadvisedly, but by one of its most solemn proceedings—a law of king, lords, and commons—to pay the parties who thus became the creditors of the nation, not in a depreciated currency, but in cash, six months after the termination of the war. To pretend, after this, that one-third may be taken from the interest of the debt, as more than due because paid in cash, is not merely to propose a violation of contract; it is to make one of the most impudent attempts to defeat the meaning of a contract by false construction, that was ever exposed to the indignation of the honest part of mankind. It is chicanery which would disgrace the lowest pettifogger.

Of the class in parliament, who show their disinclination to pay the public creditors, there is one portion, who assume a different ground. They say that it would be a dreadful thing not to pay our debts. No event is more to be deprecated. The nation ought to pay its creditors as long as ever it can. But a time may come when ability will cease.

And the case is made out clearly by a scrap of lawyers' Latin: *Nemo tenetur ad impossibile.*

The first remark to be made upon this apology, propounded by anticipation, for the non-payment of the national creditor, is, that it disclaims and condemns the preceding pretence, that we have now a right to deduct any thing from the interest of the debt, on the score of over-payment; since it declares that it would be a dreadful crime to deduct any thing, so long as we have the means of paying.

A disgraceful proceeding, founded upon a silly pretence, gives evidence both against the intellects and morals of the parties who figure in such a scene.

What would be thought of the honour of a man in ordinary life, who, having contracted a greater debt than he liked to pay, should begin to desire his creditors to make up their minds to a time when he would be unable to pay them, though it were obvious to all the world that he had ample means of paying, and never, without the most disgraceful conduct, could be destitute of such means? Would not all the world say that the man was a villain, and was already in wait for a plausible occasion to defraud his creditors; more especially if the state of the law, or the state of the contract with his creditors was such, that they could never enforce repayment of the principal, and must remain content, unless at his own choice, with the perpetual receipt of interest?

But to know the nature of this inability of the English nation to pay its debts—this prophetic inability, the forerunner of a prophetic bankruptcy—we ought to examine it a little more narrowly. The nation must, at any rate, not speak of inability, so long as it has one farthing of extravagant expenditure. The man, who pretends a want of ability to pay his debts, without confining his expenditure within the limits of rigid necessity, is a dishonest man, and ought to receive the punishment of a knave. The expenditure of the English Government is perfectly enormous. Every useless penny must be deducted from it; the services which it is necessary to receive from government, must be paid for at the lowest rate; and every article of

national economy must be set to side, and applied to the liquidation of the debt, before we can allow liberty, without all the disgrace which belongs to the proceedings of a fraudulent bankrupt. We must not leave one director in existence. We must not have one agent of government in any department more than is needed, and every agent must be paid at the lowest rate at which a competent person will consent to serve. In regard to soldiers and sailors we must make a rigid estimate of the number for which we have real services, and not allow the existence of an individual more. If it should even be found upon an honest scrutiny, that if ever we have enemies, it will be our own fault, we need have no defenders, and must discharge them every one. If we have any foreign dependency which does not pay its own expenses, we must relinquish it. The crown lands are no inexhaustible resource. They must all be sold to the last acre; and every public building, house, and palace, not absolutely necessary—not required for the real service of the state—must be converted into money for the payment of our debts. The teachers of religion are a class of public servants, who, in proportion to what they do, are more extravagantly paid than any other. There can be no doubt, that with proper management, religion might be much better taught at one quarter of the expense. All the rest must go to the discharge of the debt, before we can pretend that we have reduced our expenditure to the utmost, and are still unable to meet the just demands of our creditors. On this subject we might go into much greater detail, but this may show the nature of the case.

Still we have not ascertained what meaning can really be annexed to the term inability, when the inability is alleged of the English nation to pay its debts. In the way in which it is used, it is a vague, equivocal term, unavoidably subservient to delusion, and very apt to be made subservient to fraud. Inability very often means nothing more than disinclination. Let us examine if it can be any thing different here.

The annual produce of the nation is the fund from which all its expenses are

defrayed. Of this, that portion which is necessary for the maintenance of its labourers, can never be reclaimed, hence it can never be diverted from that use. The rest is all distributed to the owners of rent, the receivers of profit, or the receivers of the taxes. Now, let us suppose, for a moment, that the actual creditors are the only recipients of the taxes. The net annual produce would then be distributed in proportion among three parties—the landlord, the capitalist, and the national creditors. How can the inability ever arise of wanting to distribute it in those proportions? Or how could the proportions stand otherwise than by giving more to one, or to another? This would not be inability, it would be design.

If the allegation be, that by the legislature's adding more and more to the national debt, and thus creating its national creditors to a greater and greater share of the annual produce, in the end will come when the nation will be unable to pay, the very hypothesis is absurd. Why should we take it for granted, that we are to have in future a wiser legislature? and that the English nation is never to be without a government, driving it on to its ruin? Above all things, why should this strange assumption be proclaimed by the nation itself? Why should we not suppose, as is more probable, that sooner or later we shall have a legislature, which will pursue the opposite course; and by cutting off all unnecessary expense, gradually diminish, and, at no distant time, extinguish the debt?

But in the loose talk, which we so commonly condemned as idle in the subject, and in which it is so commonly taken for granted, that a bad government will go on adding to the national debt, of course entitling the national creditors to a greater and greater share of the annual produce, we must not permit the consequence, which is regularly entailed, to pass without being duly estimated.

It is obvious, that just in the same proportion, and in the same degree, as the income of the landlord and the capitalist is reduced, in order to give the tenant-holder, the income of the fundholder is reduced in order to pay interest. The fundholders contribute to their own ruin.

ment, in the same proportion as any body else, and pay a greater and a greater share of what they themselves receive, according as the payments due to them are increased. The want of means to pay is therefore a contradiction in terms.

But we confer too much honour on this prophetic inability, by treating it as worthy of analysis. We have already seen that the pretence of a nation's inability to pay itself, that is, to make a particular distribution of its annual produce, is imposturous on the face of it. To say, or to insinuate, that England is in the state, or approaching to the state, of a nation unable to pay its debts, is an impudent denial of notorious matter of fact. The annual charge on account of the national debt is below 30,000,000*l.* Much more than double that amount is raised in taxes of all sorts; and of this vast sum, a large proportion is unprofitably spent. One word more is superfluous.

It is, however, easy to understand the feeling of an aristocratic legislature on this subject. It is by the share which the aristocracy receive of the taxes, that they derive advantage from wielding the powers of government. From that portion which is detached for the payment of the national creditor, they have the means of drawing little or no advantage to themselves. The people of England, as experience proves, may be made to submit, in time of peace, to a taxation of more than 70,000,000*l.* per annum. But if one half of this goes to the national creditors, the aristocracy are obliged to make their profit out of the other half. How much more would they make if they had both halves? And with what an evil eye, therefore, are they tempted to look upon a class of men by whom this golden stream, which ought to be their's, is intercepted!

That a class of men, who, possessing power by a firm tenure, find little occasion for intellect, should be short-sighted and inconsistent, is in the natural order of things. The aristocracy of England, in order to frighten every man who possesses a little property into an enemy of improvement, have, with a prodigious display of fear and ardour, taught, that all attempts at improvement lead to revolution, and all revolutions to the confiscation of property. Both propositions are false. But they, by defrauding the national creditors, and thereby

committing one of the most enormous acts of confiscation that ever was perpetrated on earth, would set an example of disregard to the laws of property, the bitter fruits of which they would deserve to be the first to feel. Why should the rest of the community, they to whom the interests of the fundholding class, and the interests of the landholding class, are equal, be more willing to sacrifice the fundholders to the landholders, than the landholders to the fundholders? If it be very inconvenient to the nation to pay the interest of the national debt, why not take the land to discharge the principal? This would be spoliation and injustice, most assuredly; but not one atom worse than taking the property of the national creditors.

In the growing contrariety between the state of the government, and the state of the public mind, in every country in Europe, and not least in England, there is no attentive observer of the signs of the times, who does not anticipate considerable alteration at no very distant day, in the mode of administering public affairs in that quarter of the globe. These changes, perfectly inevitable, will, it is probable, all be comparatively quiet; but that they may be so, it is of primary importance that the utmost reverence should be attached to the laws of property. The people, whom the aristocratical class are always accusing of being enemies to property, are the reverse. In the annals of mankind, there is not an instance of any great spoliation or iniquitous transfer of property, of which the people have been the authors. All such atrocities, without any exception, have been the work—as the confiscation of the property of the national creditors in England would be the work—of an aristocracy.

While property remains secure, and every one is satisfied, that what is his will be inviolably preserved to him, changes in the hands which hold the powers of government affect not the bosom of society. They may be more, they may be less, expedient; the arrangements adopted may be found perfect, they may be found susceptible of amelioration; all this experience may go on, as it ought to go on, without disturbing the peace or arresting the prosperity of the nation, till its social and political insti-

tutions are brought to perfection; provided the rights of property are held inviolable. But if, in the present state of the world, the leading class, in any country, gives the signal for a convulsion, by a shameless act of confiscation, who could wonder, if the class whom they have robbed should seek for vengeance, and if the justice of their complaints should gain to them a host of abettors?

A country's principal interests are those which are involved in its internal government. To a certain degree, its interests are also involved in its situation with regard to its neighbours; more involved, generally, in proportion as its government is bad; less involved in proportion as its government is good. The interests of a country are involved in its situation with regard to its neighbours, in two ways; by its exposure to foreign attacks; and by its external commerce.

In the present state of the civilized world, a country, wisely governed, is so little exposed to attacks from its neighbours, that nothing but an extraordinary combination of circumstances could bring such an event within the range of a rational anticipation. A well-governed country would never afford any provocation; and it would be defended with such bravery and judgment by its happy people, as would render an attack upon it, unless it were a petty country indeed, an unpromising speculation. With respect to external commerce, a country, wisely governed, would adopt the only policy good for itself, that of perfect freedom; and would wait without concern till other governments were wise enough to follow its example. Between a well-governed country and its neighbours, there would be hardly any other relation than that of good behaviour, which costs nothing.

An ill-governed country, which engages at every turn in wars with its neighbours, does, indeed, involve its interests deeply in its external relations. The expense arising from its establishments and wars burthens cruelly, if it does not finally overwhelm, it.

A great improvement took place in our foreign policy, between the beginning and end of the last parliament, for which parliament has no title to our acknowledgements. Till the death of Lord Londonderry we were in the Holy Alliance. From that time we have been gradually with-

drawing from it. The opposition party in parliament made strong objections to the principle and policy of the Holy Alliance, during the administration of Lord Londonderry, with a potent majority constantly against them. We owe the change to Mr. Canning and his associates, who appear to have disengaged the nation with prudence and felicity.

The principle of the Holy Alliance is something perfectly new in the world. It is true that it was invented to meet a perfectly new emergency. That contrariety which, as we have already intimated, is now apparent in perhaps every country in Europe, between the state of the public mind and the state of the government, had excited the apprehensions of the different governments; and the Holy Alliance was set up as a bulwark against the consequences which it portended. It was an engagement among the different governments to afford protection to one another against their own subjects; and to prevent the changes for which the altered state of the public mind was expected to present an importunate, if not an irresistible, demand.

A scheme which bore upon the very surface of it more conspicuous marks of folly, or rather of insanity, was never thought of, even by bad governments. Going upon the supposition that the public mind in each country, taken separately, was becoming too strong for its own government, taken separately, they nevertheless concluded, that the governments of all the countries taken together would be too strong for the public mind in all the countries taken together. Let us permit them to assume—to take for granted, all the effect which fancy can ascribe to their scheme; that it would check the movements towards change, which the state of the public mind should prompt in one country at a time. What would be the consequence? Only to retard the countries which were more advanced, till all were ripe for a simultaneous movement; when, of course, the impulse would be far more violent, and the changes more unsparing. That governments, with or without combination, can now turn back the tide of public opinion, it would require more than the blindness of bad governments, amid all that is passing around us, to believe; and to suppose that public opinion, still rolling on, can be always successfully resisted, would be only to

suppose that of two things, the one growing always greater, the other less, the one growing always greater will never surpass the one growing always less.

The Alien Act, the subject of declamation on both sides of both houses in the last parliament, was part and parcel of the Holy Alliance system. The war against public opinion would have been incomplete without it. When the principle of the Holy Alliance was given up, the Alien Act, after a decent period of delay, and a becoming shew of regard for an old connexion, was quietly allowed to expire.

Giving the ministry applause, for renouncing the Holy Alliance; and willing to believe that they deserve it for their conduct regarding Greece, and the new states in South America, we are doubtful with respect to Spain. We have not data on which to ground a positive conclusion. And we concur most fully in the declaration of Mr. Canning, that if, by permitting the occupation of Spain by the troops of France, one of the most impudent proceedings in the history of modern Europe, and directly insulting to the government of England, we avoided that dreadful calamity, a war; it was expedient to pocket the insult, and cherish the advantages of peace.

The two questions are, whether this act of the French Government, on which Mr. Canning now bestows abundant reprobation, might not have been prevented without a war? And whether, if permitted, it would not bring war at an early date, as its natural consequence? Mr. Canning says, No. But Mr. Canning, with the advantage of more knowledge of the circumstances than other men, has the disadvantage of his situation, which plays with many blinding influences on his understanding. At the time of which we speak, the situation of the French government was so precarious, it had so much to apprehend, and did apprehend so much, from the contrariety between itself and the public mind, that it could not have looked upon the dangers involved in a struggle with this country without the utmost apprehension. It is true the French Government had one ground of security. On this it is probable that it rested; and the event discovered the sagacity of its anticipation. It knew that the aristocracy of England had a dread

Sess. 1826.

of the contrariety between the state of public opinion and the state of government in France, from the effect which it might have in England, not much less intense than that which agitated the French government itself. It concluded, therefore, that the English ministry would be deterred from risking a war with France, not so much from any aversion to the burthens it was to load upon the people of England, which it had never seen an English ministry much to dislike, as from the prospect of a new revolution in France, which it had abundant reason to know was the object of their perfect horror. The French government, therefore, put on a bold face; and dread of the state of the public mind in France, made dupes of the English ministry. Without affirming that this was the case, we affirm the strong probability that it was; and we confess our apprehensions, that the same poor game will be played over again, in the circumstances to which the occupation of Spain by the troops of France has recently given birth. France may continue to lend the most effectual support to the Spanish government, maintaining garrisons in all its strong places, saving it from all apprehension on account of its disaffected population, thereby enabling it to send every Spanish soldier to fight the English, and supplying it secretly with the sinews of war; and, doing all this, if it only avoids notorious acts of hostility, and gives fair words, to which it seems inclined, our ministry will not dare to attack it. The French government knows that the hands of the English ministry are tied up by their trembling dread of revolutions. And we therefore expect to see it treating all their remonstrances with perfect indifference; and them, notwithstanding their talk about English honour and power, submitting tamely, and only anxious about the means of hiding the truth from the English people.

The terms of our treaty with Portugal may have required our interference. This we shall not dispute. But one thing we take upon us to affirm, with unhesitating conviction, that it will be worse than childish to commence a war against Spain, if that be the fruit of our late pacific policy, without ordering the French government, under all the consequences of being considered a partner in the war, to withdraw its soldiers, to the last man,

from the peninsula ; and to abstain from every act, open or clandestine, of support to our enemy, under pain of its being treated as an act of hostility.

Notwithstanding the improvements, which we are happy to acknowledge, in the maxims of our international policy, we perceive that our ministers still adhere to one principle, of fatal import to the interests of every country the counsels of which it infects. They boast of the high rank which we hold among surrounding nations. They speak magnificently of the maintaining of that rank. If this high rank meant a high reputation for wisdom—a high reputation for virtue—a high reputation for the goodness of our government—for the integrity of our dealings, and the happiness of our people; even a high reputation for internal strength, and for the energy with which any attack upon our shores would be repelled—we desire to see that sort of rank as high as it can be desired by any body. But if this rank mean nothing but the weight with which we interfere in the arrangements, amicable or hostile, of other nations with one another—that is to say, the fear with which we inspire them; in other words—the proximity of the prospect we bring to them of the evils of war, to be inflicted by our hands; we say, that of all the curses, which ever beset a nation, this said rank is one of the greatest. Of all successful pretences for unnecessary wars—of all successful pretences for exorbitant establishments, military and naval—for the waste and ruin of the substance of the people—this is, beyond comparison, the most fertile in mischief. To the aristocracy of England this has been the grand resource for keeping up that immense taxation out of which they have drawn their profit. And, accordingly, both sections of that aristocracy, both the section in place, and the section out of place, have always applauded it to the skies. This was national glory—this was national honour. What so admirable as honour and glory? What honourable and glorious man but would part with life and fortune to preserve honour and glory? Let us then have great fleets, great armies; let us interfere in every dispute between every two nations in Europe; and let us always make war upon those who will not do as we bid them; all for honour and glory! The pretence, which is sometimes set up, that this is the cheapest way of de-

fending our own shores from hostile attacks, we cannot regard as worthy of a serious exposure.

We are told that it keeps danger at a distance. We should rather say, that it makes it continually present. What is the danger we have to dread? The expense of repelling an attack from our shores. This, which would be an expense of rare occurrence—which rather, under a good government, we should say, would not occur at all—and which, when the occasion arose, would be proportioned to it, and no more; we are told that we ought to replace, by an expense never intermitted, which never ends—not proportioned to the defence of ourselves, but to the attack of others—the continental attack; an expense so threatening—continually threatening, to other nations—that our word should hold with them the place of a command. This is to defend ourselves at an expense many thousand times greater than needful.

Would we then, it is asked, have no foresight in our counsels? O, yes! of real foresight as much as you please—as much as possible. But not a foresight which makes the remedy many times worse than the disease. Not a foresight which would make a disease, not very likely to happen at all, but sure, at the very worst, to happen rarely, perpetual. Not a foresight, which would set up a great present evil, to fence against one which is not only distant and problematical, but which can always be provided for time enough, when there is some reason to apprehend its approach.

In tracing, as we have done, in this review of the proceedings of the last parliament, the workings of the aristocratic interest; adducing the evidence of its ascendancy, and marking the consequences which flow from it; we shall be told, that we have omitted in our calculations, an element which greatly modifies and corrects the tendency of the aristocratic preponderance; to wit—the opposing party in parliament. It appears perfectly certain to us, that the modification derived from this element is too small to be worth including in the calculation.

It is an historical fact, worthy of better understanding than it generally gets, that wherever the powers of government have been engrossed by an aristocracy, they have almost always broken themselves into two sections—the one of

immediately wielding the powers of the body—the other angry that it is not wielding them. What are the consequences of this? Not that either section ever loses sight of those interests which it has in common with the other, and which belong to the whole aristocratical body. These the section out of power is as deeply concerned to preserve and to improve, as the section which it wishes to supplant. Whatever other points they may differ in, here their differences will be more apparent than real; or if, from accident, there should be occasional contrariety, there is sure to be general concurrence. This is enough:—the aristocratical interest has little to dread from such an opposition as this.

There are two cases of the division of a governing aristocracy. One case is, when the people have no idea of taking power from the aristocratical body, though they may assist in taking it from one section to give it to another. The other case is, when the aristocracy are aware of a wish on the part of the people to diminish their power, and to give that ascendancy in the legislature to the general interest, which is held by the aristocratical interest.

The nature of the contest between the two sections of an aristocratical body, is very different in these different cases. In the first case, in which as a body they have nothing to apprehend from the people, they set no bounds to their animosities; they rush on to bloodshed; and inflict upon one another the greatest atrocities. Witness the contests in Greece and Rome; witness the civil wars in every part of Europe, up completely to the period at which a real public opinion made itself felt in that part of the world. So much already does society owe to the check which apprehension of the people has imposed on the aristocracy!

In the case in which the body of the aristocracy dread the sentiments of the people, and consider the probability, that, in a desperate struggle between two parties of themselves, the people will find the means of stripping them of all that portion of their power which is inconsistent with good government, both sections find motives exceedingly to modify and restrain their exertions; and whether to get place, or retain it, never venture farther than a certain moderate excitement of public opinion.

The section not in place, the section weakest, at least for the time, seeks to make itself a match for its antagonist. It can obtain the needful accession of strength only by gaining the people on its side. It can gain them on its side only by making them expect advantages from its ascendancy. The only real permanent good which the people can receive at the hands of any existing set of administrators, is the rectification of the state of interests in the legislature; the all important change from the predominance of the partial, to that of the general interest. No aristocratical section will hold out this prospect, at least in earnest. It holds out the prospect of some other petty advantages, which it tries by every artifice to make the people admire as great; or, if it does throw out an appearance of intending the substantial good, it is an appearance only, well contrived to be explained away, or forgotten, when the period for the congruent action arrives.

The consequences are easily anticipated. So long as the people are dim-sighted enough to be imposed upon by delusive appearances, and take small advantages for great, they may be caught by the promises of an opposition, and being warmed by degrees into enthusiasm, may call for a change of administration. This call, in this country, has in former times been so importunate as to render it convenient to comply with it. When, however, the people become sufficiently clear-sighted to distinguish appearance from reality, and a great advantage from a little one, the promises of one section of the aristocracy, trying to turn out another, lose their effect.

Things have very nearly come to this pass in England: the consequence is, that the out-section of the aristocracy, ceasing to draw any hopes from the people, manifest sentiments towards them hardly less hostile than those of their opponents. "His Majesty's opposition" is a name which has been recognized as well adapted to them, *ipsis non recusantibus*. This is a name which proclaims their equipment for court service, and the dissolution of their connexion with the people. Disjoined from the people, an opposition section of the aristocracy is perfectly insignificant. We see accordingly with what rapidity our opposition party is melting away. In a short time, there

will be no such thing. The British aristocracy will form one homogeneous body, at once the masters and creatures of the ministry, soliciting and intriguing for the good things in distribution, but never going into opposition, with a view to force a greater share into their hands. This was the state of the French aristocracy, from the time of Louis XIV. to the revolution. And it is the natural state of a ruling aristocracy in every country in which the people are either unable or unwilling to force, by their aid, a discontented section of it into power. No: from this time onwards, or till an adequate reform of the parliament has place, the ministers of the king, as the part of the legislature on which public opinion acts with the greatest force, will be the *best* part of the legislature, with the exception of a small number of independent, enlightened men, hated by both parties, and persecuted by them, as far as it can be done quietly and by stealth.

The proportion of the time and attention of the last parliament, which was

absorbed by the memorable inquiry, of which it pleased them to become the instruments, respecting the late Queen, may render it, to some persons, a matter of surprise, that we have not enlarged upon this subject at a proportionate length. We deemed it unnecessary. All England—all Europe—and the world, have pronounced an opinion upon that affair, and the matters connected with it (the manly revenge, for example, taken on Sir Robert Wilson) so decided, and so nearly correct, that there is very little in the existing impression, which we have a desire to see altered. The sort of intellect, and the sort of morality, which reside in the two houses, found on that occasion, a most felicitous opportunity of displaying themselves. The time was come, when the lookers-on could benefit by the exhibition. The time is come indeed, when nothing can hinder the accumulation of evidence; and nothing can hinder the effect which it is calculated to produce.

THE END.
